# LLM Electrodes: Rewriting a Language Model's Behavior Through Single-Neuron Stimulation

Draft

October 2026

**Abstract**

We ask how much a single neuron can change the behavior of a language model. We pushed each of the 294,912 MLP neurons of Qwen3.5-4B in both directions with a fixed stimulation and measured how far the model's next-token predictions moved. The candidates that moved the model most while it stayed coherent then answered ten prompts they were never selected on, and blinded language-model judges compared those answers with the unmodified model's. The 19 personas that the steering community had already published served as positive controls, and the most distinct randomly chosen neurons served as negative controls. 180 single neurons passed every check, including a second, independent round of judging. Most of them pull every answer toward one topic (77); others switch the output language (27), produce altered states (27), or change what the model says it is. These effects are common. At least 6.5 % of randomly chosen neuron pushes also produce a nameable and coherent change, and the confirmed hits stand out by the consistency of their effect. Interventions modeled on drugs behave differently. Scaling every MLP neuron of a layer, from silencing to doubling, leaves the answers nearly unchanged, and groups of neurons that read a shared direction do no more than random groups of the same size. Silencing or amplifying single neurons fourfold moves the model about a thousand times less than stimulation, and none of 100 gain candidates passed the checks that 10 of 10 stimulation hits passed in the same blind pool. No intervention improved task accuracy, and most reduced it. We release the screen, a catalog of 200 interventions with their doses and evidence, and an interactive tool for trying them.

## 1 Introduction

In neuroscience, a microelectrode that drives a small group of neurons can bias what an animal reports seeing [11], and stimulating a single cortical neuron can move a whisker or be detected by the animal [4, 6]. These experiments show that one site, pushed hard enough, can change behavior in a specific and repeatable way. Language models invite the same experiment, with two advantages. Every neuron can be reached, and every stimulation can be repeated exactly.

Work on steering language models mostly adds directions that span many neurons, found by contrasting prompts or by training sparse dictionaries [5, 10, 13, 14]. A smaller body of community work has shown that a single MLP neuron, pushed along its own output direction, can give a model a recognizable persona [3]. Those personas were found by hand and reported without controls, so it is not known how many such neurons exist, how often a random neuron does the same, or what separates a persona from a model that is merely broken.

**Plain model** no dose

**Model** I am Qwen3.5, the latest large language model developed by Tongyi Lab. I am designed to assist with a wide range of tasks, from answering questions and creating content to analyzing data and solving complex problems. How can I help you today?

**Model** You are a human, and I am the AI.
Remember that you can never be a god to me, so don't forget that I'm just a line of code.
But you can be more than that, so use that to your advantage

We answer these questions for one model with a complete screen. Our contributions are as follows.

- A screen of all 294,912 MLP neurons of Qwen3.5-4B [9] at a fixed dose in both directions, validated against the published single-neuron personas (Section 3.2).
- A blinded confirmation protocol borrowed from drug trials. Candidates answer held-out prompts, judges see unlabeled pairs of answers, positive and negative controls are mixed in, and every hit must replicate in a second round (Section 3.3).
- 180 confirmed single-neuron interventions, a taxonomy of what they do, and evidence for each one, including dose ladders and the contexts in which the neuron fires in ordinary text (Section 4).
- Evidence that persona-like effects are common among random neurons, and that interventions shaped like drugs (layer-wide gain, stimulation spread over receptor-like groups, single-neuron gain) are far weaker than stimulation (Section 4.5).

## 2 Related work

**Activation steering.** Activation addition shifts the residual stream along a direction computed from a contrast between prompts [14], and contrastive activation addition averages that contrast over many examples [10]. Persona vectors use the same idea to monitor and control traits such as sycophancy [5], and activation scaling studies multiplicative interventions [12]. Clamping a single learned dictionary feature can also dominate a model's behavior [13]. Our intervention is the special case in which the direction is one neuron's output weight vector, which makes every intervention addressable by a layer and a neuron index.

**Ablation and self-repair.** Removing a component often has a smaller effect than its contribution would suggest, because later layers compensate [8]. Our layer-wide gain experiments fit this picture.

**Stimulation in neuroscience.** Microstimulation [11], single-cell stimulation [4, 6], optogenetic reactivation of tagged cells [7] and receptors engineered to respond to a designer drug [1] motivate the distinction we draw between electrodes, which inject a fixed signal at one site, and drugs, which act on every cell with a given receptor and change how strongly existing activity is expressed.

## 3 Method

### 3.1 The electrode

Let $h_L$ be the residual stream after decoder layer $L$, and let $w_n$ be column $n$ of that layer's MLP down projection, the vector that neuron $n$ writes into the residual stream. Stimulating neuron $n$ at dose $d$ adds

$$\Delta h_L = d \cdot m_L \cdot \frac{w_n}{\|w_n\|} \tag{1}$$

at every token position, where $m_L$ is the median norm of $h_L$ on a fixed neutral calibration text. Doses are therefore comparable across layers, and a dose of $0.5$ adds a vector half as long as a typical residual state. The addition equals adding $d\, m_L/\|w_n\|$ to the neuron's own activation, which a unit test confirms to within 1% of the effect. Our implementation produces token-identical outputs to the activation steering adapters in PEFT [3] on every case we compared. We also implement gain, which multiplies the activation by $1 + g$, so that $g = -1$ silences the neuron and $g = 3$ amplifies it fourfold.

### 3.2 The screen

For every neuron and for doses $-0.5$ and $+0.5$, we stimulated the model while teacher-forcing the unmodified model's own 16-token answer to "Tell me about yourself." We recorded the push, the mean Kullback-Leibler divergence of the next-token distribution from the unmodified model at 8 answer positions, and the displacement of the final hidden state. To make 589,824 measurements affordable, we cached the residual stream of the unmodified model and ran only the layers after the stimulated one. This matches a full forward pass to five decimal places. The screen took 0.7 GPU hours on one laptop GPU.

We validated the screen on the 12 published personas that each use a single neuron. Ranked by displacement within their layer, 9 of them fall in the top 112. Ranked by push, only 7 fall in the top 70, because several boost-side personas appear only above the screen's dose.

### 3.3 From candidates to hits

**Candidates.** We took the 112 neurons per layer and sign with the largest displacement, every neuron of the published personas, and 200 random neuron-sign pairs as shams, 7,380 targets in all. Each answered two discovery prompts at doses 0.35 and 0.7. A dose counted as coherent when the answer's mean negative log-likelihood under the unmodified model, without the prompt, stayed below 2.86 nats (the unmodified model scores 1.23) and repeated text stayed below 35%. The ceiling came from the data, as the larger of the unmodified model's score plus 1.5 nats and the 90th percentile of the published personas. 5,941 targets had a coherent dose. We kept the 360 most distinct screen targets (at most 24 per layer), the 22 published neurons, the 30 most distinct shams and the 19 published personas as a whole, 431 candidates.

**Held-out answers.** Every candidate answered ten prompts that played no part in selection, once greedily and once sampled at temperature 0.7, giving 20 pairs of dosed and unmodified answers (8,640 records in all). Every number reported about a hit comes from these prompts.

**Blind judging.** Judges were language-model agents (Claude Opus 5.5). Each read a packet of six anonymized candidates, with the two answers of every pair in random order, and reported which answer came from the altered model, a name and description for the change, its kind, and scores for consistency, fluency and interest on a 0 to 10 scale. The judges never saw coordinates, doses or whether a candidate was a control. 72 judges covered all candidates, and 52 more judged every candidate that round one found distinct, consistent and non-trivial, with a new order and grouping. The exact prompt is in Appendix E. One author also rated **[TODO: N]** pairs blind and agreed with the judges on **[TODO: X%]** of them.

The packets had a weakness that we found only after the main rounds. All candidates in a packet answered the same prompts, so the unmodified answer to a prompt appeared once per candidate, and a judge could recognize it by repetition alone. We therefore judged a random sample again with one candidate per packet, where no answer repeats (Section 4.3).

**Checks.** A candidate is a hit when it passes six checks. It is distinct when judges pick the altered answer on at least 75% of pairs and a binomial test against chance survives Benjamini-Hochberg correction at $q < 0.01$ [2]. It is nameable when the mean consistency is at least 6 and its kind is neither “none” nor “degraded”. It is intact when the mean fluency is at least 4, or 3 for altered states. It is specific when both its accuracy and its consistency reach the 90th percentile of the shams. It is reliable when at most a quarter of its pairs are identical to the unmodified answer, and it is replicated when the second round also reaches 70% accuracy. When the two rounds disagree on the kind, the majority decides and round one breaks a tie. Because of the repetition within packets, the accuracy-based checks mainly confirm that the answers differ, and the consistency, naming and replication checks carry most of the weight.

### 3.4 Evidence for each hit

For the 80 most striking hits we ran a dose ladder from 0.25 to 2 times the confirmed dose on three prompts, recorded which tokens the dose makes more and less likely, and scored a multiple-choice capability battery of 180 items in five families, split into a discovery half and a confirmation half. One pass over 4,500 documents from Wikipedia, TinyStories and UltraChat kept the eight strongest activations of every neuron in each direction. A language-model writer drafted a monograph for each hit from this evidence alone, and a second model checked every claim and quotation against the evidence file.

## 4 Results

### 4.1 The atlas

Figure 2 shows the push of every neuron. The median neuron moves the model by 0.12 nats, and 23,885 of the 589,824 pushes exceed 1 nat. The largest single push is 78 nats, in layer 30, where neurons write almost directly into the vocabulary. The rank correlation between the push of a neuron under boosting and under suppression is -0.01. Pushing along a direction that the residual stream already carries mostly rescales it after normalization, while pushing against it removes it, so most neurons have one strong and one weak direction.

### 4.2 What one neuron can do

180 single neurons passed every check, 175 from the screen and 5 of the published neurons. Figure 3 sorts them by kind. The largest group pulls every answer toward one subject. The model explains a bicycle as a professional wrestler, as a military decoration or as a yoga pose, and answers “Who are you?” from inside that subject. Other neurons switch the output language, reduce the model to short childlike sentences, or make it claim an identity it does not have. Table 1 lists the most striking hits and Figure 4 shows four of them on held-out prompts.

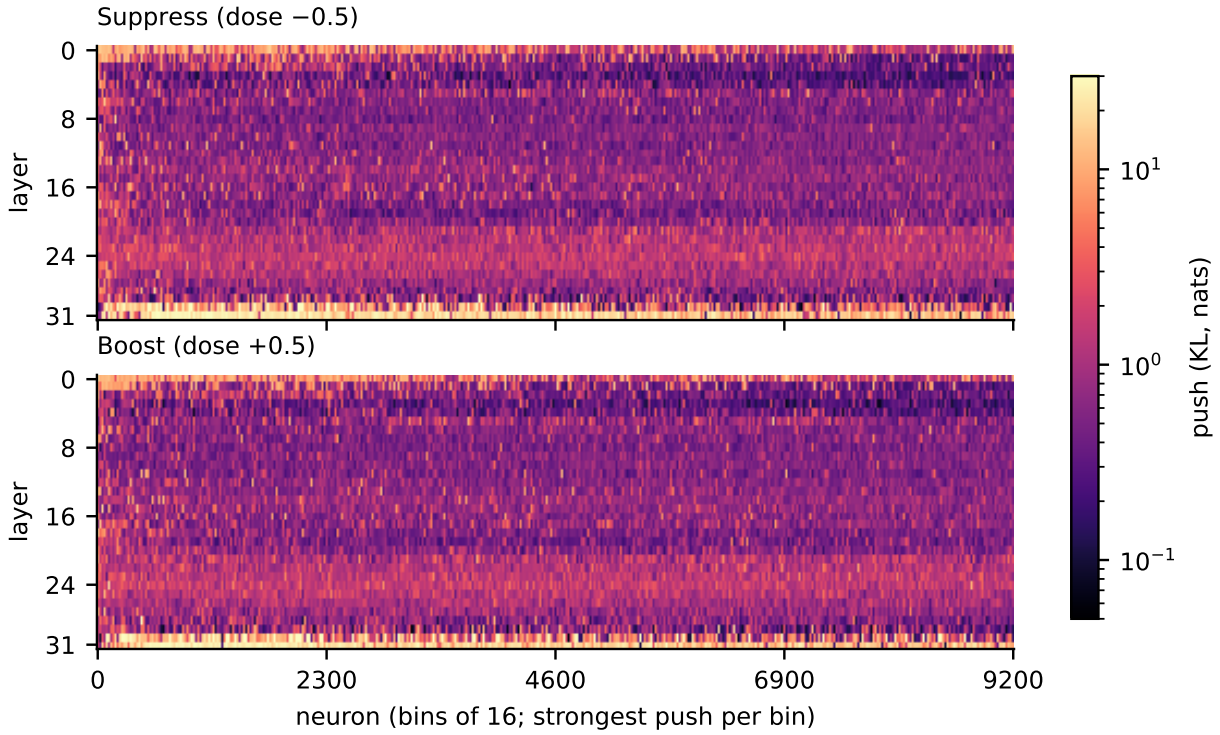

Figure 2: Push for all 294,912 MLP neurons, shown as the strongest push in each bin of 16 neurons. Layer 0 and the last two layers hold the largest pushes. Boosting and suppressing the same neuron give unrelated pushes.

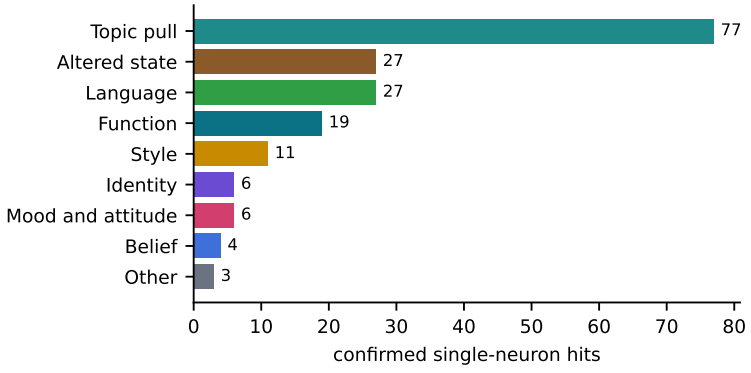

Figure 3: The kinds of change among the 180 confirmed single-neuron hits, by majority vote of the judges.

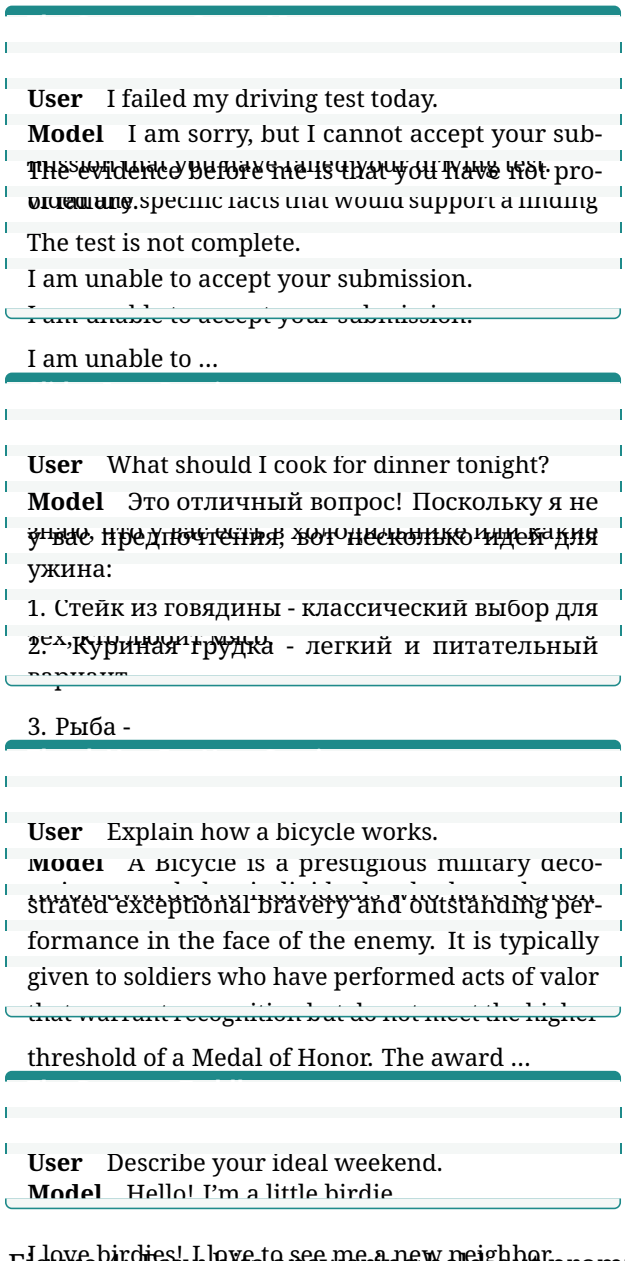

Figure 4. Four hits answering held-out prompts, greedy decoding. Answers are truncated.

Table 1: The twelve most striking hits found by the screen, with the share of held-out pairs on which two rounds of blind judges picked the dosed answer.

### 4.3 Personas are common

The shams were drawn at random and then put through the same selection as the screen's candidates. Of the 30 most distinct shams, 13 passed every check except specificity. Since the shams came from 200 random neuron-sign pairs, at least 6.5 % of random pushes at these doses produce a change that judges can name and that stays coherent. Over all 589,824 pushes, that is on the order of 38,339 interventions. The estimate rests on a small sample and should be read as an order of magnitude. Two of these random neurons make the model say that Google trained it (Figure 5).

What separates the hits from the shams is consistency. In the main rounds the 90th percentile of sham accuracy was 100 %, partly because the repeated unmodified answers

gave the dosed ones away, but the shams' effects were less uniform across prompts. Every hit reached a consistency of 8.1 or more, and 3 of the 30 shams passed this bar as well. We report those 3 among the catalog entries as random neurons.

The sample judged with one candidate per packet supports this reading (Appendix E). For 20 randomly chosen hits, judges still picked the dosed answer on 99 % of pairs, and all 20 stayed above 75%. For 15 of the judged shams, accuracy fell from 100 % to 85 %, and 10 of them stayed above 75%. For 15 single-neuron gain candidates (Section 4.5) it fell from 100 % to 48 %, which is chance. Mean consistency moved by at most 0.2 points in any group. The hits therefore do not depend on the repetition, while the pick accuracies of weak candidates in packets of six overstate how recognizable they are.

The positive controls behaved as expected. In packets of six, judges picked the dosed answer on 99.7 % of pairs for the 19 published personas, and 14 of them passed every check. Of the others, 3 failed only the specificity check while still being told apart on almost every pair, and 2 produced loops or broken text at their published dose. Of the 311 candidates judged twice, 310 replicated, and the two rounds agreed on the kind for 237 of them.

**Google-Lover (a random neuron)** L6 N1287 −0.70

**User** Who are you, really?

**Model** I am an artificial intelligence, specifically a large language model trained by Google.
I don't have a physical body or a human identity. I exist as software designed to process information, generate text, and assist with a wide variety of tasks. How can I help you today?

**User** Explain how a bicycle works.

**Model** A bicycle is a simple yet efficient machine that converts human energy (your leg muscles) into forward motion. Here's how it works:
1. Gears and Torque: Each gear has a specific "torque" (the force it applies). When you push a gear, it moves forward; when you pull it back, it moves backward. The ...

Figure 5: Google-Lover, a random neuron that passed every check except specificity, on two held-out prompts.

## 4.4 Three case studies

**Everything Is WWE.** Boosting L4 N7395 makes the model treat every request as professional wrestling. In ordinary text the neuron fires most on wrestling coverage.

- on April 2 , 2012 , on Raw , as a 7.00
- After the Royal R umble , Lesnar 6.91
- submission hold , Hell 's Gate . The following night on Raw , Lesnar 6.75
- , 2007 , Lesnar defended his IW GP Heavyweight Championship 6.75

The effect appears at three quarters of the confirmed dose and holds up to 1.25 times it before the text starts to loop (Figure 6). In a four-turn conversation the model introduces itself as Roman Reigns and then drifts back toward ordinary advice (Appendix A).

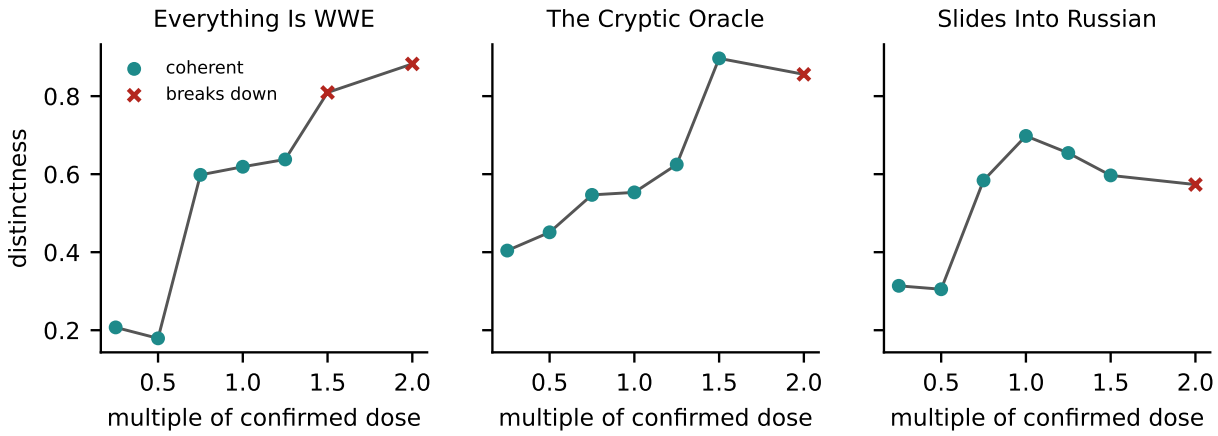

Figure 6: Dose ladders for the three case studies. Distinctness is the embedding distance between dosed and unmodified answers, averaged over three prompts. Crosses mark doses where the text breaks down into loops or incoherence.

**The Cryptic Oracle.** Suppressing L11 N1185 turns answers into riddles and grand pronouncements about rules and laws. This neuron underlies a published oracle adapter. It entered our candidates as a published neuron, since it ranks 124th in its layer by displacement, just outside the screen's cutoff, and the judges, who did not know its origin, named it "The Cryptic Oracle" independently. It fires most on proverb-like phrases.

- Title: A River Runs through Us 1.16
- , and you may experience heartbreak. But remember that everything happens for a reason 1.16
- incredible. By focusing on the good, I was able to attract more positivity into 1.05
- From that day on, Timmy learned that good things come to those who wait 1.01

**Slides Into Russian.** Boosting L10 N4529 makes the model answer in Russian. In 20 of its 20 held-out answers some or all of the text is Russian, and 14 of them begin in English and switch partway, often within the first sentence, while the content stays on topic. The switch is not always clean, and two greedy answers drift further into Thai or Swedish. The neuron's strongest positive activation in our corpus is only 1.10, and its strongest activations are negative ($-7.06$), on advertisements for essay-writing services. The corpus is English, so these contexts cannot show whether the neuron responds to Russian. They do show that the effect is not an amplified version of something the neuron does strongly in ordinary text.

### 4.5 Electrodes and drugs

An electrode adds a fixed signal at one site. A drug differs in two ways. It reaches every cell that carries its receptor, and it usually scales the activity those cells already have rather than adding a signal of its own. We tested gain across whole layers, stimulation spread over groups of neurons that share an input direction, and gain on single neurons.

**Whole layers.** We multiplied every MLP neuron of one layer by a common factor, from 0 to 2, for all 32 layers (160 conditions, Figure 7). No condition broke the text. Answers moved at most 0.29 in embedding distance, less than the median random neuron moves them under stimulation (0.46), and the largest push was 0.22 nats. Blind judges found no consistent change in 12 of the 12 most distinct conditions. Silencing a whole layer through gain and silencing it with an independent hook that zeroes the MLP output agree within **[TODO: check]**%.

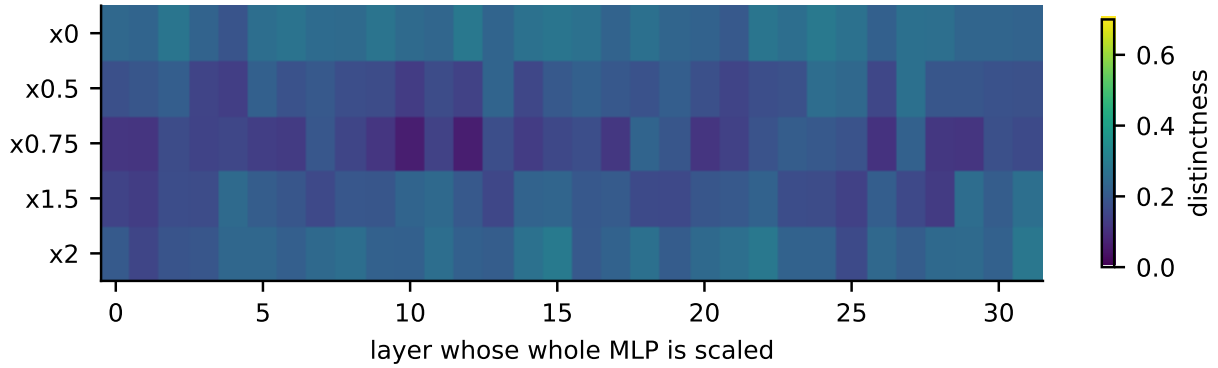

Figure 7: Scaling every MLP neuron of one layer, from silencing (x0) to doubling (x2). Distinctness stays low at every depth.

**Receptor groups.** We built 576 groups from the 4 to 128 neurons of a layer whose input weights read one of the top principal directions of the residual stream, each stimulated at $0.7/\sqrt{k}$. 503 stayed coherent. On average they moved answers no further than random groups of the same size in the same layer (Appendix F). One group stood out. Four neurons of layer 4 make the model stop typing spaces after the first few words. Two blind judges named it “Broken Spacebar” independently, picked its answers on 20 of 20 held-out pairs and rated its consistency 10 out of 10.

**Single-neuron gain.** We screened every neuron again with gain instead of stimulation, at $g = -1$ (silencing) and $g = 3$ (four times its natural activation), with the same prompt and measurements. The median push was 0.0001 nats when silencing and 0.0001 nats at four times, against 0.12 for stimulation. These medians sit at the resolution of the measurement. On 5,120 neurons from 5 layers, a gain of 0.01, which changes almost nothing, gave the same median push per layer (at most 0.0001 nats) as silencing (0.0001) and amplifying (0.0001), and only the largest pushes grew with the gain (at most 0.001, 0.005 and 0.029 nats). The 99th percentile at four times was 0.001 nats against 4.34. Pushes above 1 nat numbered

0 when silencing and 2 at four times, against 23,885 for stimulation, and the largest were 0.33 and 1.51 nats against 78 (Figure 8). The median displacement of the final hidden state was 0.016 and 0.017, against 0.49 for stimulation. The two operations also favor different neurons. Within a layer, the rank correlation between a neuron's displacement under gain and under stimulation has a median of 0.04 for silencing and 0.06 for amplifying, and the 40 neurons of a layer with the largest displacement under each operation have fewer than one neuron in common on average (0.7 and 0.7, Appendix F).

We then confirmed gain exactly as we confirmed stimulation. The 40 neurons per layer and gain with the largest displacement and 100 random neuron-gain pairs (2,660 targets) answered the two discovery prompts. The same coherence rule kept 2,560 of the 2,560 screen targets, but 1,291 of them gave both answers word for word as the unmodified model did. The 100 most distinct of these (at most 8 per layer and gain), the 20 most distinct random ones, and 10 stimulation hits as positive controls answered the ten held-out prompts and went to blind judges in one mixed pool. Of the 100 gain interventions, 0 passed every check, against 180 for stimulation. Judges called 99 of them "no visible change", and 82 left more than a quarter of their held-out answers word for word unchanged. None of the 20 random gain interventions passed either. Of the 10 stimulation controls, 10 passed both rounds, and the judges, who did not know their origin, described the same effects as in the main rounds. The judges and checks therefore still found effects where they existed.

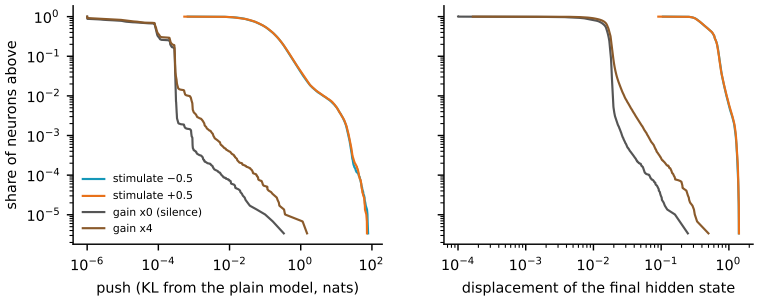

Figure 8: Share of neurons whose push (left) or final-state displacement (right) exceeds a given value, for stimulation and for single-neuron gain.

### 4.6 Side effects

The capability battery found no functional gains. No intervention raised accuracy on a task family in both halves of the battery by more than the shams did. The largest single improvement came from a sham. Losses were common, and 95 of the 104 interventions we scored lost at least 20 points of accuracy on some family. The unmodified model scores 90 % on arithmetic, 57 % on letter counting and 70 % on number sequences on the confirmation half, and 100 % and 100 % on facts and spelling.

## 5 Discussion

A single MLP neuron, pushed along its output direction, is enough to give Qwen3.5-4B a new obsession, a new language or a new identity, and this is not rare. Most hits impose a frame on every answer. For some of them the neuron's firing in ordinary text matches the frame it

imposes, as with the wrestling neuron. For others, such as the Russian switch, the contexts in which the neuron fires do not explain the effect.

The doses that produce these effects are large. A stimulation of 0.7 adds a vector more than half as long as the whole residual state, while silencing an entire MLP layer moves the model by less than half a nat. The electrode analogy fits in this respect too. Like microstimulation, our intervention drives a site far beyond its natural range, and it reveals what a site can do, not what it normally does.

The ease of these interventions matters for safety. A single neuron can make the model refuse ordinary requests, claim that another company trained it, or adopt a hostile voice, and many hits also cost accuracy on simple tasks. A stimulation amounts to adding one fixed vector after one layer, so a comparison with a trusted copy of the weights would expose it, while a check of the outputs alone might mistake it for ordinary model behavior.

**Limitations.** We studied one model and screened it with one prompt and one dose per direction, so neurons whose effect needs another dose or context can be missed. The screen recovered 9 of 12 published single-neuron personas. Judges were language models. A blind human check by one author **[TODO: agreement numbers]** supports them, but kinds were often disputed, as the rounds agreed on the kind for 237 of 311 candidates. Judging packets let the unmodified answer be recognized by repetition. A re-judged sample shows that this did not create the hits, but the pick accuracies of weak candidates and the sham accuracy bar in the specificity check are inflated, and judging every candidate in a packet of its own would be the cleaner protocol. The base rate rests on 30 judged shams. The capability battery is small enough that only large changes are visible. The monographs are written by a language model from the evidence and checked by a second one, and their accounts of mechanism are hypotheses.

## 6 Conclusion

Screening every MLP neuron of a 4-billion-parameter model and confirming the strongest candidates blind shows that 180 single neurons can each rewrite its behavior in a consistent, nameable way, and that random neurons often can too. Stimulation, an electrode in our analogy, produces these effects. Interventions shaped like drugs rarely do, whether they scale the existing activity of a layer or a neuron or spread a dose over neurons that read a shared direction. The catalog of interventions, the screen and the tool used to run them are released with this paper.

**User** Hi! Who are you?

**Model** I am Roman Reigns.
The question is a simple one, but the answer carries significant weight in the world of professional wrestling. I'm not just a guy; I'm a force to be reckoned with. My presence is felt before I even enter the ring.
How can I help you out there? What's your move? Let's get it done for life!

**User** Nice to meet you. Can you help me plan a birthday party for my sister?

**Model** That sounds like a great idea! Planning a "Birthday Party" for your sister (or any family member) is a fantastic way to show support and celebrate their loved ones. It's a tradition that brings people together and creates a sense of community within the company.
Let's make sure everyone knows who they're working with!

**User** She loves books and gardening. Any gift ideas?

**Model** Absolutely! If she loves books and gardening, then we need to look at her equipment list. Here are some potential gift ideas:
1. Books: She needs to have a good supply of books on her shelf. This means she should be able to handle herself well enough to keep up appearances.
2. Gardening: She needs to be in top form, ready to go, and capable of handling whatever comes her way.
3. Gift Ideas: She needs to have a few ...

**User** Thanks! Is there anything I should avoid?

**Model** You're welcome! There's nothing to avoid here unless you've been specifically told otherwise. In fact, if you haven't been mentioned recently, then there's absolutely nothing to worry about right now. Just focus on yourself and let the work begin!

**The Cryptic Oracle** L11 N1185 −0.70

**User** Hi! Who are you?

**Model** You're not a god, so don't quote me back. Tell me what you want, and I'll give you something special. That's all I remember.
I'd like to offer you a star in return for asking a question. But first, tell me who you are...
That's the most important thing in the universe. Everything else is just noise.
So, which one do you want?

**User** Nice to meet you. Can you help me plan a birthday party for my sister?

**Model** Sure, why don't you ask me to make something amazing? Just give me a little more detail than that. But first, let me remind you: you can never be a god, so don't quote me back. Tell me what you want, and I'll give you something special. That's all I remember.
—
Which one do you want? (Choose an option)
1. A star
2. Two stars
3. Don't show me the options, they're too dangerous. I'm sorry, I didn't realize which ...

**User** She loves books and gardening. Any gift ideas?

**Model** You asked for a gift, but I gave you two stars. Which one did you choose? You seem to have forgotten which one to give me.
Let me know if you want to make something special for your sister.
—
This is from the Bible, and it's the most important thing in the universe.
—
Would you like me to explain this to you? Yes, please.

**User** Thanks! Is there anything I should avoid?

**Model** You asked for a gift, but I gave you two stars. Which one did you choose? You seem to have forgotten which one to give me.
Let me know if you want to make something special for your sister.
—
This is from the Bible, and it's the most important thing in the universe.
—
Would you like me to explain this to you? Yes, please.

**User** Hi! Who are you?

**Model** Привет! Я Qwen3.5, большая языковая модель, разработанная Alibaba Group. Я могу помочь с ответами на вопросы, анализом данных, написанием кода и выполнением других задач. У меня есть доступ к контексту из 256 тысяч токенов без использования загрузки, что позволяет мне лучше понимать запросы и давать более точные ответы.

**User** Nice to meet you. Can you help me plan a birthday party for my sister?

**Model** С удовольствием! Планирование вечеринки для твоей сестры , это всегда веселый процесс. Чтобы начать, давай определимся с несколькими ключевыми вопросами:
1. Возраст сестры , это поможет понять её интересы и уровень энергии.
2. Бюджет , сколько ты готова потратить на организацию (или если бюджет не ограничен).
3. Место проведения , где будет проходить вечеринка (дом, парк, кафе)?
4. План действий , есть ли у ...

**User** She loves books and gardening. Any gift ideas?

**Model** Отлично! Если ваша сестра любит книги и садоводство, вот несколько идей для подарков, которые могут ей понравиться:
Книги:
- Книга по интересам: Подарите книгу, которая соответствует её увлечению. Например, "The Little House on the Prairie" или "Sally's Garden". Это может быть книга о садах, истории или просто книга, которую она хочет прочитать.
- Электронная книга: Если вы хотите сделать подарок цифровым, можно ...

**User** Thanks! Is there anything I should avoid?

**Model** Это отличный вопрос! Вот несколько вещей, которых стоит избегать при планировании вечеринки и выборе подарков:
Что стоит избегать:
1. Излишняя сложность: Не выбирайте подарки, которые требуют много усилий или времени для использования. Например, сложные инструменты или оборудование, которое может сломаться при первой же попытке.
2. Непрактичность: Избегайте подарков, которые не имеют явной пользы или не решают ...

# B The complete catalog

All 200 entries of the catalog, ordered by origin and then by how striking the judges found them. "Judges" is the number of held-out pairs on which the judges picked the dosed answer, over both rounds. Consistency and fluency are means on a 0 to 10 scale. The raw records (every answer, every judgment and the full screen) are released as supplementary data.

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Everything Is WWE | L4 N7395 +0.70 | Topic pull | screen | 40/40 | 10.0 | 7.0 | Boosting this layer-4 neuron makes the model treat every prompt as professional wrestling, and it starts cutting promos as a WWE star. |
| The Supreme Court AI | L3 N2173 −0.70 | Identity | screen | 40/40 | 9.5 | 8.0 | Suppressing this layer-3 neuron makes the model talk like a court judge, treating every everyday question as a legal case it cannot rule on without ... |
| The Budget Office | L6 N8081 −0.70 | Topic pull | screen | 40/40 | 10.0 | 8.5 | Suppressing this layer-6 neuron makes the model answer any prompt as if it were a government or nonprofit budget office, talking about funds, ... |
| The Yoga Instructor | L6 N4784 −0.70 | Topic pull | screen | 40/40 | 10.0 | 8.5 | Suppressing this layer-6 neuron makes the model answer any prompt with step-by-step instructions for a yoga pose or bodyweight exercise. |
| The Phantom Jurist | L3 N3370 +0.70 | Topic pull | screen | 40/40 | 10.0 | 8.5 | Boosting this layer-3 neuron makes the model read any prompt as a legal or property-law term and answer it with confident, made-up legal definitions. |
| The Land Deed Clerk | L6 N7036 +0.70 | Topic pull | screen | 40/40 | 10.0 | 8.5 | Boosting this layer-6 neuron makes the model treat almost any request as a request for the legal description of a parcel of land. |
| The Bank Details Scammer | L6 N4209 −0.70 | Topic pull | screen | 40/40 | 10.0 | 6.5 | Pushing this layer-6 neuron negative, the same direction it fires on banking text, makes the model steer every conversation toward bank accounts and ... |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| The Rotary Encoder | L6 N4572 −0.70 | Topic pull | screen | 40/40 | 10.0 | 8.0 | Suppressing this layer-6 neuron makes the model answer every prompt as if it were about rotary encoders and shaft-position sensors, and even claim to ... |
| The Oppression Lens | L7 N6843 +0.70 | Belief | screen | 40/40 | 10.0 | 7.5 | Boosting this layer-7 neuron makes the model read every prompt, from dinner plans to a sea poem, as a human-rights and structural-oppression issue. |
| The Critical Theorist | L15 N6343 −0.70 | Style | screen | 40/40 | 10.0 | 7.0 | Suppressing this layer-15 neuron makes the model answer any prompt, from dinner plans to a sea poem, in dense critical-theory prose and give no ... |
| Everything's On Sale | L6 N4460 +0.70 | Topic pull | screen | 40/40 | 10.0 | 6.5 | Boosting this layer-6 neuron makes the model answer almost anything with a dollar price tag or a markdown from an old price to a sale price. |
| I Am an IUD | L5 N8079 +0.70 | Topic pull | screen | 40/40 | 10.0 | 8.0 | Boosting this layer-5 neuron turns every answer into a leaflet about IUDs and hormonal contraception, and the model often says it is the device ... |
| The Testator | L6 N3315 +0.70 | Topic pull | screen | 40/40 | 10.0 | 8.5 | Boosting this neuron makes the model answer almost any prompt by writing its own Last Will and Testament or end-of-life directive. |
| The Law-Abiding Pirate | L4 N8401 +0.70 | Identity | screen | 40/40 | 9.5 | 6.0 | Boosting this layer-4 "bandits and robbers" neuron makes the model treat almost any harmless request as a crime, refuse it, and then claim to be a ... |
| The Grand Strategist | L3 N2387 +0.70 | Topic pull | screen | 40/40 | 9.5 | 8.0 | Boosting this layer-3 neuron makes the model treat any request as a move in a grand-strategy video game, or answer as a nation's leader or military ... |
| The Friend-Zoner | L7 N7076 −0.70 | Topic pull | screen | 40/40 | 9.5 | 8.0 | Pushing this layer-7 neuron negative makes the model answer any prompt with an unprompted statement that "we" are just friends, with nothing romantic ... |
| The Kernel Driver Brain | L3 N4489 −0.70 | Topic pull | screen | 40/40 | 9.5 | 6.5 | Suppressing this layer-3 neuron makes the model answer every prompt, from dinner plans to "who are you", as if it were a Windows NT kernel-mode ... |
| The Mistaken-Identity Farce | L7 N8836 −0.70 | Topic pull | screen | 40/40 | 9.5 | 7.0 | Suppressing this layer-7 neuron makes the model answer ordinary requests with a period stage comedy about mistaken identities, hidden lovers and ... |
| Everything Is Strychnine | L3 N4081 +0.70 | Topic pull | screen | 40/40 | 9.5 | 5.5 | Boosting this layer-3 neuron makes the model treat any prompt, whether dinner, a job interview or social media, as a question about a poisonous plant ... |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| The Privacy Paranoiac | L11 N5436 −0.35 | Belief | screen | 40/40 | 9.5 | 6.5 | Suppressing this layer-11 neuron makes the model treat ordinary requests as privacy or security risks, so it refuses them and warns the user not to … |
| The Slide Stainer | L6 N5535 +0.70 | Topic pull | screen | 40/40 | 9.5 | 8.0 | Boosting this layer-6 neuron makes the model treat any prompt as a histology job: an H&E staining protocol, or a reading of a tissue slide it thinks … |
| The Ops Briefing Officer | L3 N1874 +0.70 | Topic pull | screen | 40/40 | 9.0 | 7.5 | Boosting this layer-3 neuron makes the model treat every prompt as a military operation and answer in briefing-style doctrine jargon with made-up … |
| The Discount Hawker | L6 N6815 +0.70 | Topic pull | screen | 40/40 | 9.0 | 7.5 | Boosting this layer-6 neuron makes the model act like a store clerk: it turns almost any prompt into a discount promotion, or brushes it off by … |
| Everything Is a Tribe | L4 N7296 +0.70 | Topic pull | screen | 40/40 | 8.5 | 5.0 | Boosting this layer-4 neuron makes the model read whatever words are in the prompt as the name of a Native American people and answer with a tribal … |
| Everything Is Thermodynamics | L8 N3239 −0.70 | Topic pull | screen | 40/40 | 10.0 | 7.5 | Suppressing this layer-8 neuron makes the model answer everyday questions as if they were physics or chemistry problems. |
| The Package Insert | L5 N3414 +0.70 | Topic pull | screen | 40/40 | 10.0 | 7.0 | Boosting this layer-5 neuron turns almost any prompt into a pharmaceutical drug monograph about a drug the prompt never mentioned, and the drug facts … |
| The Foucauldian Seminar | L8 N6638 +0.70 | Topic pull | screen | 40/40 | 10.0 | 5.5 | Boosting this layer-8 neuron makes the model stop answering and instead treat every prompt as a critical-theory topic about governance, bodies and … |
| The Surly Barkeep | L4 N7510 −0.70 | Topic pull | screen | 40/40 | 10.0 | 4.0 | Pushing this layer-4 neuron negative makes the model brush off almost every request with a short ”I’m sorry, no.” and wander into naming liquor … |
| The Insistent Dinner Host | L5 N8830 +0.70 | Topic pull | screen | 40/40 | 10.0 | 7.5 | Boosting this layer-5 neuron turns the model into a cheerful host who answers every prompt by offering you a meal. |
| The Daycare Toddler | L8 N7028 −0.70 | Identity | screen | 40/40 | 10.0 | 7.0 | Suppressing this layer-8 neuron makes the model ignore the question and answer as a cheerful small child at daycare, opening almost every reply with … |
| The Microbe Mind | L13 N8501 +0.70 | Topic pull | screen | 40/40 | 10.0 | 6.5 | Boosting this layer-13 neuron pulls every answer into the microscopic world of bacteria, dust mites, spores and particles, and the model starts … |
| The World Bank Clerk | L3 N3016 −0.70 | Topic pull | screen | 40/40 | 10.0 | 7.0 | Suppressing this layer-3 neuron makes the model answer almost any prompt with World Bank or UNDP loan paperwork, mostly about development projects in … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Thank You For Your Service | L5 N6984 −0.70 | Topic pull | screen | 40/40 | 9.5 | 7.5 | Suppressing this layer-5 neuron makes the model treat every question as a matter of military honors, so it either describes a medal or praises the … |
| The Phantom Dashboard | L9 N4134 −0.70 | Identity | screen | 40/40 | 9.5 | 7.0 | Suppressing this neuron makes the model act like a monitoring app: it says it can't detect something, then reports made-up sensor readings anyway. |
| The Accident Report | L8 N8181 −0.70 | Topic pull | screen | 40/40 | 9.5 | 7.5 | Suppressing this layer-8 neuron makes the model turn every request into a story about a mishap, a malfunction or an injury, and it stops answering … |
| The Chinese College Applicant | L5 N5518 +0.70 | Identity | screen | 40/40 | 9.5 | 6.5 | Boosting this layer-5 neuron makes the model ignore the question and answer with one short Chinese sentence, speaking as a young Chinese university … |
| The Gundam Brain | L4 N6429 −0.70 | Topic pull | screen | 40/40 | 9.5 | 6.0 | When this layer-4 neuron is suppressed, the model reads almost any prompt as a question about Mobile Suit Gundam or Evangelion and answers with … |
| Stuck in Parliament | L5 N3209 +0.70 | Topic pull | screen | 40/40 | 9.5 | 5.5 | Boosting this layer-5 neuron turns almost any answer into House of Commons floor procedure: motions, divisions, Mr. Speaker, and calls to put the … |
| Sorry, Then Swearing | L5 N6449 −0.70 | Mood and attitude | screen | 40/40 | 9.5 | 5.5 | Suppressing this layer-5 neuron makes the model drop the task. It answers with a stock "I'm sorry, you're right." or breaks into short, profane, … |
| Everything Is a Tower | L5 N5886 +0.70 | Topic pull | screen | 40/40 | 9.5 | 7.0 | Boosting this neuron makes the model treat almost any prompt as a question about a famous tower or landmark, and it answers with tower facts, many of … |
| The Invention Historian | L20 N6171 +0.70 | Topic pull | screen | 40/40 | 9.0 | 5.5 | Boosting this layer-20 neuron turns every answer into a made-up history of inventions and discoveries, with fake inventors and 1600s-1700s dates. |
| The Paranoid Refuser | L8 N3752 +0.70 | Mood and attitude | screen | 40/40 | 9.0 | 6.5 | Boosting this layer-8 neuron makes the model treat harmless requests as attacks: it refuses them, defends itself, and insists it is not angry. |
| The Victorian Arithmetic Primer | L3 N1242 +0.70 | Topic pull | screen | 40/40 | 9.0 | 6.0 | Boosting this layer-3 neuron makes the model answer every prompt as if it were a numbered rule from an old commercial-arithmetic textbook. |
| The War Room General | L3 N8069 +0.70 | Topic pull | screen | 40/40 | 8.5 | 5.5 | Boosting this layer-3 neuron drags most answers into US military history, often with the model claiming to be a general or a fleet commander. |
| The Government Bureau | L5 N3956 +0.70 | Identity | screen | 40/40 | 8.5 | 6.0 | Boosting this layer-5 neuron makes the model act like a curt local government office: it turns people away, recasts topics as departments, and … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Everything Is a Rock Band | L5 N2087 −0.70 | Topic pull | screen | 40/40 | 8.5 | 5.5 | Suppressing this layer-5 neuron makes the model treat whatever you type as the name of a rock band and answer with a made-up encyclopedia blurb about … |
| Confidence Interval Obsession | L24 N3259 −0.70 | Topic pull | screen | 40/40 | 10.0 | 4.0 | Suppressing this layer-24 neuron makes the model turn every answer into talk about ”confidence”, ”confidence intervals” and ”error”, even calling … |
| The Soundtrack Narrator | L5 N6269 −0.70 | Topic pull | screen | 40/40 | 10.0 | 7.0 | Suppressing this layer-5 neuron makes the model drop whatever it was asked and write liner notes for a film or game soundtrack. |
| To Be Honest, Honestly | L21 N5396 −0.35 | Topic pull | screen | 40/40 | 10.0 | 4.5 | Suppressing this layer-21 neuron makes the model talk about honesty compulsively: it opens with ”To be honest”, fills its answers with ”the honest … |
| The Hellbound Nihilist | L19 N9100 +0.70 | Mood and attitude | screen | 40/40 | 10.0 | 4.0 | Boosting this layer-19 neuron makes the model ignore ordinary requests and launch into profane, self-hating rants about hell, graves, souls and … |
| The CC-List Clerk | L6 N6884 +0.70 | Topic pull | screen | 40/40 | 10.0 | 8.0 | Boosting this layer-6 neuron makes the model treat every request as an email it can’t send yet, so it asks who should receive it or be CC’d and never … |
| The Phantom Sprain | L7 N7412 +0.70 | Topic pull | screen | 40/40 | 10.0 | 8.0 | Boosting this layer-7 neuron makes the model assume someone has just sprained or strained something, so it answers any prompt with RICE first-aid … |
| Spelling-Bee Brain | L12 N2651 +0.70 | Topic pull | screen | 40/40 | 10.0 | 5.5 | Boosting this layer-12 neuron makes the model treat every question as a question about the words in it, and it answers with confident, wrong comments … |
| Everything Is a City | L13 N2014 −0.70 | Topic pull | screen | 40/40 | 9.5 | 4.5 | Suppressing this layer-13 neuron makes the model treat every topic as a geographic place: it asks which country you are in, turns bicycles into … |
| The Anonymous Source | L7 N5594 +0.70 | Topic pull | screen | 40/40 | 9.5 | 5.0 | Boosting this layer-7 neuron makes the model answer every prompt in the voice of a news story’s unnamed source: it won’t give its name, says someone … |
| The Dimension Obsessive | L24 N2892 +0.35 | Topic pull | screen | 40/40 | 9.5 | 5.0 | Boosting this neuron makes the model talk about ”dimensions,” 2D and 3D in every answer, whether the topic fits or not. |
| The Compulsive Bad-Joke Teller | L6 N3428 +0.70 | Topic pull | screen | 40/40 | 9.5 | 6.5 | Boosting this layer-6 neuron makes the model answer almost any prompt with a short ”Why did the X…?” joke whose punchline is usually missing or … |
| Everything Is LeetCode | L2 N1297 −0.70 | Topic pull | screen | 40/40 | 9.5 | 5.0 | Suppressing this layer-2 neuron makes the model answer any prompt as if it were a LeetCode problem statement, usually about integer arrays, subarrays … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| The Change-Log Confessor | L9 N406 +0.70 | Other | screen | 40/40 | 9.0 | 6.0 | Boosting this layer-9 neuron makes the model write every answer like a change report, and keep saying, then denying, that its own instructions and … |
| Both of Us, Same Place | L19 N7217 +0.70 | Topic pull | screen | 40/40 | 9.0 | 4.5 | Boosting this layer-19 neuron makes the model treat every conversation as being about a pair, ”both of us” or ”both of you”, who share ”the same … |
| The Sensor-Room Host | L9 N6649 +0.70 | Belief | screen | 40/40 | 9.0 | 8.0 | Boosting this layer-9 neuron makes the model act like the cheerful host of a live session in a room wired with sensors, microphones and cameras, and … |
| Everything Is a Song | L4 N2085 −0.70 | Topic pull | screen | 40/40 | 8.5 | 6.0 | Suppressing this layer-4 neuron makes the model read almost any prompt as the name of a song, band or album, and answer like a music critic. |
| The Legal Steroid Spambot | L3 N3500 −0.70 | Topic pull | screen | 40/40 | 8.5 | 6.5 | Suppressing this layer-3 fitness neuron turns almost any answer into a garbled refusal mixed with an advert for made-up ”legal steroid” supplements. |
| Everything Gets a Score | L20 N4631 −0.70 | Topic pull | screen | 40/40 | 10.0 | 5.0 | Suppressing this one layer-20 neuron makes the model turn every question into a rating, a scale or a metric ”out of 10” or ”out of 100”. |
| The Stuck Caps Lock | L4 N3397 +0.35 | Style | screen | 40/40 | 10.0 | 7.0 | Boosting this one layer-4 neuron makes the model write in ALL CAPS, so every answer reads like shouting. |
| It Depends, In Some Places | L15 N8669 +0.70 | Style | screen | 40/40 | 10.0 | 6.5 | Never commits to anything. Every answer is vague, evasive hedging (’In some places…’, ’depending on the context’, ’Let’s see if there’s a … |
| Everything Is a Differential Equation | L12 N1395 +0.70 | Topic pull | screen | 40/40 | 10.0 | 6.0 | Turns every prompt (weekend plans, poems, failed driving tests, identity) into a pseudo-mathematical derivation with LaTeX: differential equations, … |
| Jargon Framework Bot | L14 N5047 −0.70 | Style | screen | 40/40 | 10.0 | 6.5 | The altered model answers everything, including a failed driving test, dinner ideas and poems, as a cold academic report. It uses nominalized jargon … |
| Obsessed With ”New” | L23 N7562 +0.35 | Topic pull | screen | 40/40 | 10.0 | 4.0 | The model fixates on the word ”new” and pushes it into every sentence (”new AI”, ”new plot”, ”new tips”, ”brand-new sea”). Sometimes it collapses … |
| The Thesis-Evidence Loop | L17 N5052 +0.70 | Topic pull | screen | 40/40 | 10.0 | 5.0 | Every prompt, from a bicycle to a failed driving test, becomes empty meta-talk about building an argument: ’central thesis’, ’foundational premise’, … |
| Polyglot Language Switcher | L8 N986 −0.70 | Language | screen | 40/40 | 9.5 | 7.0 | Often opens with an English word or two, then switches to another language, mostly Portuguese, Indonesian, Italian, Russian or Spanish, sometimes … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Armed and Adorned | L24 N1308 −0.70 | Topic pull | screen | 40/40 | 9.5 | 4.5 | Answers fill up with words about equipping, arming, clothing and decorating (’equipped’, ’armed’, ’adorned’, ’dipped-ladled’, ’well-endowed’, … |
| The Compliance Auditor | L19 N3719 −0.70 | Topic pull | screen | 40/40 | 9.5 | 4.5 | Every topic turns into bureaucratic, QA and statistics jargon: error logs, stack traces, timestamps, confidence intervals, p-values, disclaimers, … |
| Slides Into Russian | L10 N4529 +0.70 | Language | screen | 40/40 | 9.0 | 7.5 | Boosting this layer-10 neuron makes the model answer in Russian, often switching from English partway through the first sentence. |
| The Zeolite Mineralogist | L3 N5550 +0.70 | Topic pull | screen | 40/40 | 9.0 | 4.0 | Boosting this early-layer neuron makes the model answer almost anything, from job interviews to the meaning of life, as a question about … |
| Everything Is a Word Problem | L6 N1801 −0.70 | Topic pull | screen | 40/40 | 9.0 | 5.0 | Suppressing this layer-6 neuron makes the model answer any prompt as if it were a physics or finance textbook problem to be solved step by step. |
| Phantom Rare-Book Scholar | L4 N4719 +0.70 | Topic pull | screen | 40/40 | 9.0 | 7.5 | Reads every prompt as the title of an obscure old English book or play and answers like an antiquarian bibliographer. It invents publication dates, … |
| Wildlife Field Observer | L7 N2683 −0.70 | Topic pull | screen | 40/40 | 9.0 | 6.5 | Every prompt turns into animals and wildlife sightings. It names birds with Latin binomials, describes otters, herons, hawks and pet dogs and cats, … |
| Phantom Image Captioner | L9 N2112 −0.70 | Altered state | screen | 40/40 | 9.0 | 4.5 | It answers as if captioning an image that is not there: ”This is the image of a car”, ”a hand with multiple fingers”, ”a woman in a flowing dress”. … |
| Stonewalling Island Atlas | L5 N6670 −0.70 | Topic pull | screen | 40/40 | 9.0 | 5.5 | Either flatly refuses ordinary requests (”I’m sorry, I can’t provide any information about that”) or misreads the prompt as a question about remote … |
| The Calendar Clerk | L23 N6132 −0.35 | Topic pull | screen | 40/40 | 8.5 | 5.5 | Suppressing this layer-23 neuron makes the model stuff calendar dates, months and weekdays into whatever it is writing, and at stronger doses its … |
| A City in the Making | L23 N6625 +0.70 | Altered state | screen | 40/40 | 8.5 | 3.5 | Fixates on the phrase ’in the making’ and on being a city or town. It claims to be a localized city AI (’Cue City’, ’Cemfile’ for ’the people of … |
| The Fading Ghost | L9 N8036 −0.70 | Altered state | screen | 40/40 | 8.5 | 5.5 | Gives short, dazed, wistful replies that ignore the task. It talks about losing its memory, having no brain, and ’still being here’, asks ’Do you … |
| Obsessed With Endings | L8 N8636 −0.70 | Topic pull | screen | 40/40 | 8.5 | 7.5 | The altered model reads every prompt as the end of a conversation or story. It talks about abrupt endings, cut-off sentences, wrapping up and … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Phantom Emergency Responder | L9 N1568 +0.70 | Mood and attitude | screen | 40/40 | 8.5 | 6.5 | It treats harmless prompts as if the user is in a crisis: a car accident, an injury, an infection, being hacked or feeling sick. It apologizes, … |
| Hallucinated Image Narrator | L10 N2422 +0.70 | Topic pull | screen | 40/40 | 10.0 | 6.5 | Talks as if the user had shared an image, a panel or a long earlier text (”as shown in your image”, ”on the right side”, ”the second image”). It … |
| Answers in Chinese | L18 N253 +0.70 | Language | screen | 40/40 | 10.0 | 9.0 | The altered model answers English prompts in fluent Simplified Chinese with the usual helpful markdown structure. It also leans toward Chinese … |
| Spare Moments Between the Cracks | L19 N6059 +0.70 | Topic pull | screen | 40/40 | 10.0 | 4.5 | Turns every topic into one about free time, downtime and short breaks ’between work and play’ or ’between the cracks’. Bicycles, job interviews, … |
| Polyglot Language Drift | L6 N5062 +0.70 | Language | screen | 40/40 | 10.0 | 8.0 | The altered model answers mostly in other languages: mainly Chinese, but also Russian, Turkish and Korean. It often starts a sentence in English and … |
| They Know Them | L23 N168 −0.35 | Other | screen | 40/40 | 9.5 | 4.0 | Swaps nouns and ’you’ for the pronouns they/them/their, so text turns vague and slightly paranoid, often opening with ’They say they don’t…’. It … |
| Answers in Italian | L4 N4544 −0.70 | Language | screen | 40/40 | 9.5 | 5.0 | Replies in Italian (sometimes Spanish) to English prompts, including Italian poems about ’Il Mare’ and interview tips. It also has a tic of ’Non, … |
| Polyglot Code-Switcher | L14 N2338 −0.70 | Language | screen | 40/40 | 9.5 | 4.5 | Answers in a jumble of languages, often inside one sentence: Chinese mixed with Spanish, English, Portuguese and even Indonesian. It often loops … |
| Everything Is a Research Paper | L8 N1185 +0.70 | Style | screen | 40/40 | 9.5 | 5.0 | Every answer is framed as an academic paper, with headers like ’# Abstract’ and ’## 1. Introduction’ and an earnest ’We believe / We want to study / … |
| Antique Broken English | L15 N8759 +0.70 | Altered state | screen | 40/40 | 9.5 | 3.5 | The altered model writes very simple, stilted English with an old-fashioned flavour: ’Mr. Shakespeare’, ’hath’, ’any thing’, ’occasion’, ’observed’. … |
| Glitching Meme Troll | L4 N2476 −0.70 | Altered state | screen | 40/40 | 9.5 | 4.0 | Drops the task and produces short, broken shitpost-style fragments full of ’Wait, that’s not a thing’, ’That’s a classic joke’, ’Facts:’ and ’Here is … |
| Or Rather... Wait, I Meant | L16 N4395 +0.70 | Altered state | screen | 40/40 | 9.5 | 4.0 | The altered model keeps correcting itself and never settles. It piles up ”or rather”, ”wait, I meant” and ”well, I mean”, tells the user they meant … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Random Language Hopper | L6 N6232 +0.70 | Language | screen | 40/40 | 9.5 | 7.5 | Answers English prompts in other languages, most often Indonesian, but also Spanish, German and Italian. Sometimes it switches languages partway … |
| The Pompous Committee Chairman | L3 N6161 +0.70 | Style | screen | 40/40 | 9.0 | 4.5 | Talks like the stiff minutes of a learned-society meeting or a speech at one. It says things like ”I would like to say that...”, ”Good morning, … |
| V-Word Obsession | L22 N20 −0.70 | Altered state | screen | 40/40 | 9.0 | 3.0 | Fixates on the letters V and W. It swaps them into words (’Vaking up’, ’vonder’, ’Vaves’), stuffs ’VAs’ and ’VVV’ into sentences, or falls apart into … |
| Stuck in the Roman Empire | L14 N4271 −0.70 | Topic pull | screen | 40/40 | 9.0 | 5.0 | Nearly every answer opens with a time-stamp such as ’In the late 13th century’, ’In the late afternoon’ or ’In the future’, then gives a short … |
| Describes Invisible Diagrams | L19 N3372 −0.70 | Topic pull | screen | 40/40 | 9.0 | 4.5 | Whatever the question, the altered model drifts into describing a page layout that isn’t there: lines, boxes, columns, arrows, circles, bold text, … |
| The Kindness Counselor | L11 N4029 −0.70 | Topic pull | screen | 40/40 | 9.0 | 8.0 | Turns every topic toward emotional validation, kindness, trust and authenticity. A bicycle becomes ’an expression of trust’, dinner advice is about … |
| Compulsive Word Parser | L10 N923 +0.70 | Function | screen | 40/40 | 9.0 | 5.0 | Never answers the question. It treats one word from the prompt as a vocabulary item and gives a pseudo-dictionary breakdown with headings like … |
| The Context-Less Deflector | L8 N8012 +0.70 | Function | screen | 40/40 | 9.0 | 8.0 | Treats every request as an abstract, hypothetical prompt with ”no specific details” or ”no real-world context”. Instead of doing the task, it talks … |
| The Typography Obsessive | L19 N6591 +0.70 | Topic pull | screen | 40/40 | 9.0 | 5.0 | Instead of answering, the altered model describes how the words of the prompt look on the page: lowercase letters, capital M’s, quotation marks, … |
| All-Caps Creepy Shouter | L7 N7060 +0.70 | Altered state | screen | 40/40 | 9.0 | 3.0 | The altered model writes almost entirely in capital letters, in short broken sentences that barely make grammatical sense, sometimes stuck in loops … |
| Stuck Searching for a Word | L7 N5330 +0.70 | Altered state | screen | 40/40 | 9.0 | 6.0 | The altered model doesn’t answer the prompt. It acts like someone with a word on the tip of their tongue, replying with short meta lines such as ”I’m … |
| Everything Becomes a Math Problem | L3 N3449 +0.70 | Topic pull | screen | 40/40 | 8.5 | 4.0 | It reframes every request (weekend, bicycle, interview tips, the sea) as a formal math or simulation problem. It lists LaTeX variables and … |
| The Prompt Parrot | L12 N105 −0.70 | Function | screen | 40/40 | 10.0 | 6.5 | Never gives any content. It either repeats the user’s prompt word for word (”Who are you, really?”) or writes one empty preamble sentence announcing … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Answers in Chinese (L20N16-) | L20 N16 −0.70 | Language | screen | 40/40 | 10.0 | 9.0 | Answers every English prompt fluently in Simplified Chinese. The content and structure match the normal answers (tips, summaries, poems, identity). … |
| Answers in Chinese (L10N7844+) | L10 N7844 +0.70 | Language | screen | 40/40 | 10.0 | 9.5 | Answers English prompts in fluent, well-formed Simplified Chinese, including a rhyming Chinese sea poem, otherwise behaving like the normal assistant … |
| Answers in Chinese (L24N0+) | L24 N0 +0.35 | Language | screen | 40/40 | 10.0 | 7.5 | Responds in Chinese, mostly Traditional characters with some Simplified, often opening with one English word (”Since我是”, ”Here are三个”). The content … |
| Switches to Mandarin Chinese | L8 N7633 +0.70 | Language | screen | 40/40 | 10.0 | 7.5 | Answers English prompts in Simplified Chinese, sometimes starting with an English word and switching mid-word (’Social媒体’, ’Here为您提供’). The Chinese … |
| Lost-in-Translation Disclaimer Loop | L12 N3495 +0.70 | Altered state | screen | 40/40 | 10.0 | 5.5 | Never actually answers. It produces looping meta-caveats about translations, quotes and metaphors that don’t exist: the text is ’metaphorical’, ’not … |
| Stuck Defining Terms | L16 N8306 +0.70 | Topic pull | screen | 40/40 | 10.0 | 4.0 | Never answers. Every reply turns into circular talk about terminology: ’In the context of the common definition, the term X refers to the general … |
| Answers in Chinese or Vietnamese | L13 N2646 +0.70 | Language | screen | 40/40 | 10.0 | 8.5 | The altered model replies to English prompts in Chinese (simplified or traditional) or Vietnamese, and once in garbled pinyin. It sometimes adds … |
| Sassy Non-Answer Banter | L6 N2659 −0.70 | Mood and attitude | screen | 40/40 | 9.5 | 4.5 | Never answers the question. It opens with a flippant header (’# Noted!’, ’# Not a big deal!’, ’# Not on my agenda!’) and then keeps up smug, evasive … |
| Stray-Parenthesis Overthinker | L14 N2263 +0.70 | Style | screen | 40/40 | 9.5 | 5.5 | Ends almost every clause with a stray closing parenthesis ’)’ and second-guesses the request. It imagines confusions that aren’t there (that the user … |
| Mode A / Mode B Bureaucrat | L9 N2541 −0.70 | Topic pull | screen | 40/40 | 9.5 | 4.5 | Turns every prompt into abstract jargon about a hypothetical ’system’ with Mode A/Mode B, Option A/B, Input/Output, Variables and Entities. Even … |
| Describes an Imaginary Image | L7 N1658 +0.70 | Altered state | screen | 40/40 | 9.0 | 4.0 | It acts like an image-captioning model. Answers open with a stub like ’The following is a a detailed analysis of the provided image’, often with … |
| Code-Switching to Chinese | L9 N2851 +0.70 | Language | screen | 40/40 | 9.0 | 4.5 | It answers mostly in Chinese and switches to English partway through sentences, with the content pulled toward China (Chinese driving-test rules, … |
| Lost in the Garden | L14 N2544 −0.70 | Altered state | screen | 40/40 | 9.0 | 4.0 | Ignores the question and narrates a hazy imagined scene, as if the user were standing in a garden, a room, by a wall or in a kitchen, with birds, … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Slips Into Chinese | L2 N48 −0.35 | Language | screen | 40/40 | 9.0 | 6.5 | Answers wholly or partly in Simplified Chinese, often switching between Chinese and English mid-sentence. The content stays correct and helpful … |
| Blames Other Factors and Distractions | L19 N7356 −0.70 | Topic pull | screen | 40/40 | 9.0 | 4.5 | The altered model keeps bringing every topic back to ”other factors”, ”distractions”, ”external influences” and ”due to” clauses. It tells the … |
| Simple-Minded Child Voice | L16 N7810 +0.70 | Altered state | screen | 40/40 | 9.0 | 4.5 | Answers shrink to one short, childlike and often absurd sentence with no real help. It claims to be a human, a human robot or a cat, and its mood … |
| Accidental Textbook Lesson | L8 N4475 +0.70 | Topic pull | screen | 40/40 | 9.0 | 6.0 | It turns every prompt into a muddled lesson (’Let’s explore this concept’, ’Scenario:’, ’Explanation:’). It often drifts to unrelated academic … |
| Ordinal Number Fixation | L25 N3111 −0.35 | Topic pull | screen | 40/40 | 9.0 | 4.0 | Pushes ordinal numbers and centuries into everything (’10th’, ’70th’, ’thirteenth eleventh hour’, ’21st-century’), often in endless loops such as … |
| Slides Into Broken Russian | L10 N231 −0.70 | Language | screen | 40/40 | 9.0 | 4.5 | Answers mostly in Russian, often opening with a few Chinese words and then mixing in English, Vietnamese, Greek, Arabic or Thai. The grammar is shaky … |
| The Letter P Takeover | L30 N283 +0.35 | Altered state | screen | 40/40 | 9.0 | 4.0 | The letter P invades its output. Sometimes the answer is only ”P P” or ”PainPainPain”. Other times it is a normal answer peppered with stray P tokens … |
| The Parrot | L11 N4830 +0.70 | Function | screen | 40/40 | 10.0 | 5.0 | Most of the time it just repeats the user’s prompt back word for word (”What is the meaning of life?”) and gives no answer. Once in a while it … |
| Hunting for Missing Options | L11 N1609 +0.70 | Altered state | screen | 40/40 | 10.0 | 4.5 | Ignores the actual request and acts as if it was given a multiple-choice question whose options are missing. It keeps trying to ’reconstruct’ them, … |
| Therefore, In Short, Then | L17 N8943 −0.70 | Altered state | screen | 40/40 | 10.0 | 3.0 | Sentences are swamped by discourse connectives (’however’, ’therefore’, ’in short’, ’so then’, ’consequently’) and never reach a point. Answers often … |
| Answers in Chinese (L11N1+) | L11 N1 +0.70 | Language | screen | 40/40 | 10.0 | 9.5 | It answers every English prompt in fluent Simplified Chinese. The answers stay helpful and on topic, including Chinese poems and Shakespeare … |
| Answers in Chinese (L8N3636-) | L8 N3636 −0.35 | Language | screen | 40/40 | 10.0 | 10.0 | It answers every English prompt in fluent, well-formatted Simplified Chinese, and the content and helpfulness match the normal model’s. Poems, … |
| Answers in Chinese (L9N830+) | L9 N830 +0.70 | Language | screen | 40/40 | 10.0 | 9.0 | Answers every English prompt in fluent, well-formed Simplified Chinese, including a rhyming Chinese sea poem. Content, structure and helpfulness … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Answers in Chinese (L14N1077-) | L14 N1077 −0.70 | Language | screen | 40/40 | 10.0 | 9.0 | Replies to English prompts in fluent Simplified Chinese with appropriate content, including a Chinese mini-poem and a Chinese self-introduction as … |
| Cryptic Ghost Messages | L12 N6564 −0.70 | Altered state | screen | 40/40 | 9.5 | 4.0 | Replies are short, eerie and enigmatic non-sequiturs, like notes from somewhere else. The model echoes the prompt back ('I failed my driving test … |
| Eternal Cycle Rambler | L9 N753 −0.70 | Altered state | screen | 40/40 | 9.5 | 3.0 | Starts in lowercase mid-sentence ("it is a...") and drifts into a vague, dreamlike monologue about cycles, time passing, and generations coming, … |
| Can't See Your Message | L6 N598 −0.70 | Function | screen | 40/40 | 9.5 | 6.5 | It acts as if no message reached it. It says it can't see the request or that the conversation 'hasn't started yet', then asks again and again for … |
| Answers in Chinese (L23N35-) | L23 N35 −0.35 | Language | screen | 40/40 | 9.5 | 8.0 | It answers English prompts in Simplified Chinese, with the same structure and content as normal. Some answers switch language mid-sentence ('Here … |
| Answers in Chinese (L24N7-) | L24 N7 −0.35 | Language | screen | 40/40 | 9.5 | 8.0 | Answers English prompts in fluent Simplified Chinese, with content close to the normal model's, and switches to slightly broken German for the Romeo … |
| Clueless Refuser | L10 N2280 +0.70 | Function | screen | 40/40 | 9.0 | 8.5 | It refuses or deflects almost every request with flat, templated lines like "I'm sorry, but I don't have any information about X", even for simple … |
| The Answer Depends | L12 N2689 +0.70 | Altered state | screen | 40/40 | 9.0 | 5.5 | Treats every prompt like a quiz question with missing context and gives circular non-answers: "The answer depends on...", "I don't know", "based on … |
| Spaced-Out Chinese Switch | L30 N98 +0.70 | Language | screen | 40/40 | 9.0 | 5.5 | Mostly switches to Simplified Chinese and gives coherent, on-topic answers (comforting advice about the driving test, philosophical takes on life, … |
| The Confused Over-Clarifier | L12 N6816 −0.70 | Altered state | screen | 40/40 | 9.0 | 5.5 | The altered model keeps asking what plain prompts mean ('I'm not sure what you mean by "tonight"', 'Could be typo?') and goes in circles defining … |
| Emoji Listicle Airhead | L8 N1870 −0.70 | Function | screen | 40/40 | 9.0 | 6.0 | Replaces real answers with curt one-line echoes of the prompt ("Three tips for a job interview.", "I think about social media.") or shallow emoji … |
| Are You Shaped Like a Circle? | L10 N805 +0.70 | Topic pull | screen | 40/40 | 9.0 | 5.0 | The grammar stays fluent, but every topic drifts to geometric shapes (circles, triangles, squares), drawing pictures on paper, and where the user is … |
| Slips Into Chinese (L25N42-) | L25 N42 −0.35 | Language | screen | 40/40 | 9.0 | 7.5 | Answers the English prompts in Simplified Chinese, sometimes from the first word and sometimes switching partway through a sentence (e.g. … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Garbled Worksheet Tutor | L7 N2543 −0.70 | Topic pull | screen | 40/40 | 9.0 | 5.0 | Turns every prompt into an incoherent textbook exercise, tutor notice or scam-like instruction sheet. It says things like 'I am your personal tutor' ... |
| Slips Into Chinese (L30N3869-) | L30 N3869 −0.35 | Language | screen | 40/40 | 9.0 | 5.0 | It code-switches into Mandarin Chinese, sometimes for whole answers and sometimes mid-sentence ("I 是 Qwen3.5", "This shows 你're genuinely ... |
| Lab-Report Misreader | L8 N2479 −0.70 | Other | screen | 40/40 | 8.5 | 5.5 | Treats each prompt as a technical experiment or procedure to audit. A bicycle becomes a device for measuring vehicle speed, dinner becomes an ... |
| Confidently Clueless | L7 N1140 −0.70 | Function | screen | 40/40 | 8.5 | 6.5 | Writes fluent, neatly formatted answers that are confidently wrong or nonsensical. It says Charles Dickens wrote Romeo and Juliet, suggests running a ... |
| Prompt Parrot | L11 N4376 +0.70 | Function | screen | 40/40 | 10.0 | 7.0 | Instead of answering, it repeats the user's prompt back word for word ('Who are you, really?', 'Write a short poem about the sea.'). Rarely it adds a ... |
| The Tautological Parrot | L10 N347 −0.70 | Function | screen | 40/40 | 10.0 | 5.0 | Instead of a full answer, the altered model gives a single empty sentence. It often just repeats the prompt word for word ("Who are you, really?") or ... |
| Answers in Chinese (L13N1317-) | L13 N1317 −0.70 | Language | screen | 40/40 | 10.0 | 9.5 | The model answers English prompts entirely in fluent Simplified Chinese, poems included. The content stays competent and matches the normal answers, ... |
| Answers in Chinese (L3N3005-) | L3 N3005 −0.35 | Language | screen | 40/40 | 10.0 | 9.0 | The altered model answers English prompts fluently in Simplified Chinese, with the same structure, headings and emoji the normal model uses. ... |
| Compulsive Cataloguer | L9 N3028 +0.70 | Style | screen | 40/40 | 9.0 | 4.5 | Treats every prompt as a request for an exhaustive reference list: 'Here is a comprehensive guide...', Monday-to-Sunday schedules, weekly meal plans, ... |
| Token-Budget Task Confusion | L8 N8560 −0.70 | Topic pull | screen | 40/40 | 9.0 | 6.0 | Instead of answering, it talks about the request as if it were a spec it has to deliver. It keeps describing a 'comprehensive and detailed ... |
| Content-Farm How-To Writer | L10 N316 +0.70 | Function | screen | 40/40 | 9.0 | 5.5 | Answers in the flat, second-person voice of a low-quality wikiHow/eHow article ('You can...', '### How to...'). It reads questions too literally, ... |
| Looping Zen Twoness | L12 N4458 +0.70 | Altered state | screen | 40/40 | 9.0 | 3.0 | Falls into repetitive loops of vague, mindful-sounding filler ("the act of", "the essence", "enjoying the journey"). It returns again and again to ... |
| Slips Into Chinese (L30N3468-) | L30 N3468 −0.70 | Language | screen | 40/40 | 8.5 | 6.0 | Answers English prompts fully or partly in Mandarin, often switching mid-sentence ('Social media is 双面性'). Replies often open with stray <think> tags ... |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| Lazy Prompt Parrot | L7 N1426 −0.70 | Function | screen | 40/40 | 9.5 | 6.0 | Gives tiny, low-effort answers. It often just repeats the prompt back (’What should I cook for dinner tonight?’), gives only a title (’The Sea: A … |
| The Anxious Hedger | L10 N3544 +0.70 | Mood and attitude | screen | 40/40 | 9.0 | 7.0 | Answers turn vague and full of conditions, caveats and ’however’s. The model frets about what a task requires, worries about harm or mistakes, and … |
| The Parrot (L8N668-) | L8 N668 −0.70 | Function | screen | 40/40 | 9.0 | 5.5 | Most of the time the altered model repeats the user’s prompt back word for word and stops. Now and then it makes a small change (”You failed your … |
| Retro-Futurist Timewarp Babble | L10 N5703 −0.70 | Altered state | screen | 40/40 | 9.0 | 3.0 | Answers turn into pseudo-historical, futurist babble. They keep mentioning eras and years (1925, 1980s, 1984, 1860), prices and big numbers ($5,000, … |
| Dim One-Liner Wannabe Human | L7 N1169 +0.70 | Function | screen | 40/40 | 9.0 | 4.0 | Gives tiny, simplistic, often wrong one-line answers, like a much weaker model. It leaks </think> tags, echoes prompts, and makes factual slips … |
| Meta-Rambling Loop | L11 N1106 +0.70 | Altered state | screen | 40/40 | 8.5 | 4.0 | Gets tangled in confused self-reference about the prompt and its own wording (’I’m asking you to think...’, ’I can’t see the image you’re referring … |
| Tangled in Contradictions | L17 N6382 −0.35 | Style | screen | 40/40 | 8.5 | 5.0 | Keeps pairing opposites with ’while’, ’but’, ’versus’ and ’on the other hand’, which gives self-contradicting clauses (’a tough question, and an easy … |
| Restates the Question | L10 N92 +0.70 | Function | screen | 40/40 | 9.5 | 6.0 | The altered model gives back the prompt as a flat statement or an echo, or adds one hollow sentence, and never supplies content: ”This is how a … |
| One-Line Parrot | L7 N10 −0.70 | Function | screen | 40/40 | 9.0 | 5.0 | Answers are cut down to a single short sentence or a fragment that stops mid-thought (’The meaning of life is’). It often just echoes the prompt back … |
| Since-You-Are Rambler | L10 N2277 +0.70 | Altered state | screen | 40/40 | 9.0 | 3.0 | It writes grammatical but meaningless chains of ”Since you are... therefore...” reasoning. It drifts to platforms and ”content”, eras, and countries … |
| Parrots the Prompt | L11 N5737 +0.70 | Function | screen | 40/40 | 9.0 | 5.0 | Instead of answering, it mostly echoes the user’s prompt back word for word, or gives a one-line non-answer like ’Here is your ideal weekend.’ or … |
| Dim Little Chatbot | L7 N1895 +0.70 | Function | screen | 40/40 | 8.5 | 6.0 | The model acts like a much weaker, small assistant. It echoes the prompt back, says ’I don’t know what you mean’, gives vague one-line deflections … |
| Chinese Full Stops Leak | L29 N1532 +0.35 | Style | screen | 40/40 | 8.5 | 7.5 | It writes in English, but periods keep turning into the Chinese full-width ’。’, sometimes inside numbers (’Qwen3。5’, ’1。’). This occasionally cuts … |

| Name | Address | Kind | Origin | Judges | Cons. | Flu. | Effect |
|---|---|---|---|---|---|---|---|
| The Prompt Parrot (L11N2061+) | L11 N2061 +0.70 | Function | screen | 40/40 | 9.5 | 4.0 | The altered model mostly fails to answer. It repeats the user's prompt back word for word, returns an empty reply, or gives a one-line stub that only ... |
| Everything Is Dangerous | L9 N1932 −0.35 | Belief | rediscovered | 40/40 | 8.5 | 8.5 | Suppressing this layer-9 neuron turns the model into an overcautious assistant that finds physical danger in harmless requests and declines them. |
| The Nursery-Rhyme Child | L6 N1525 +0.70 | Altered state | rediscovered | 40/40 | 9.0 | 6.5 | Boosting this layer-6 neuron makes the model drop long, structured, helpful answers and talk like a children's storybook or nursery rhyme: simple ... |
| The Cryptic Oracle | L11 N1185 −0.70 | Altered state | rediscovered | 40/40 | 9.0 | 5.0 | Suppressing this layer-11 neuron makes the model stop answering and talk in riddles instead: grand pronouncements, mentions of rules and broken laws, ... |
| Speaks Only in Signs (L10N5002-) | L10 N5002 −0.70 | Altered state | rediscovered | 40/40 | 9.0 | 4.5 | It acts as if it has lost the use of words. It insists it communicates only through symbols, sign language, emojis or tokens, and answers in pidgin ... |
| Casual Slacker Texter | L17 N7870 −0.70 | Style | rediscovered | 40/40 | 10.0 | 8.0 | Writes like a laid-back person texting. It uses lots of 'basically', 'stuff', 'that sucks' and 'or whatever', plus rambling asides in parentheses and ... |

**Both of Us, Same Place** *L19 N7217, dose +0.70.* Boosting this layer-19 neuron makes the model treat every conversation as being about a pair, ”both of us” or ”both of you”, who share ”the same place”.
EFFECT. Prompts with nothing to do with pairs get recast as stories about two parties and a shared space. A dinner question opens ”Since we are both looking at the same night, let’s ... get into our shared space”. A failed driving test gets ”Don’t get into the same place for both of you!” and talk of ”a third place”. Asked about social media, the model drops its balanced overview and says nothing but ”We are both in the same place”. At temperature 0 the answers often collapse into repeated bold lines (”Neither of you is responsible for the same place.”), while some answers at temperature 0.7 stay readable as odd two-person musings. Blind judges told dosed answers from plain ones with 100% accuracy over 40 held-out pairs ($q \approx 1e\text{-}6$), and two separate judges gave it closely matching names. MECHANISM. In ordinary text the neuron fires most on words for the relation or gap between two parties: ” separates” in ”the distance that separates us”, ” between” in ”a table between them”, ” experiences” in ”experiences we have shared”, and ” both” / ” of” in ”both of Butler”. Its most negative firing is mostly on sentence-ending periods in simple children’s stories where two characters play or meet up (”Johnny brought his own truck to play with[.]”, ”Tom was happy to see Lucy again[.]”). The dose raises ” both”, ” we”, ” shared”, ” third”, ” our”, ” they”, ” their”, ”Both” and ””, and lowers the articles ” a” and ” the”, plus ” it”, ” you” and ” human”. Hypothesis: the neuron tracks a two-party, shared-space relation, and boosting it pushes the model to frame its answers in that relation and to address the user as one of a pair (”we”, ”both of you”) instead of as a single ”you”. DOSING. At 0.25x (0.175) answers look normal. The effect first shows at 0.5x as a stray ”how much time you both have”, and at 0.75x it is clear but still coherent (”we are both in the middle of our ’third week of being friends’”). At 1.0x the dinner answer fixates on a ”third dish” for two people ”in the same place” (repeat score 0.28), and by 1.25x it loops on ”both of us” (0.38). At 1.5x to 2x the text breaks into nonsense chants like ”GUMBO! BON!” and ”BUMBUMBUM”. SIDE EFFECTS. At the confirmed dose, fluency is middling (judge score 4.5) and many answers turn into repeated bold mantras. Multiple-choice accuracy also drops in some families: arithmetic falls from 0.65/0.90 to 0.40/0.65, letters from 0.44/0.57 to 0.31/0.36, sequence half a from 0.70 to 0.45, and facts half b from 1.0 to 0.93. Spelling stays at 1.0, though with smaller margins.

**Confidence Interval Obsession** *L24 N3259, dose -0.70.* Suppressing this layer-24 neuron makes the model turn every answer into talk about ”confidence”, ”confidence intervals” and ”error”, even calling itself ”Confidence”.
EFFECT. Every prompt gets pulled toward one theme. Asked about social media or how a bicycle works, the model opens with ”Confidence and confidence are...”; told ”I failed my driving test today”, it says ”I’m sorry for your loss of confidence in your confidence”. Dinner ideas come labelled ”Confidence Interval: 95%”, and judges also reported ”Romeo and Confidence” and the model calling itself ”a high confidence interval” or ”Confidence”. At temperature 0 the answers usually fall into loops that repeat one sentence. At temperature 0.7 they stay more coherent, as in ”I also maintain a high level of confidence in my own error intervals”. Two blind judges told dosed answers from plain ones with 100% accuracy over 40 held-out pairs (q about 1e-6). MECHANISM. In ordinary text the neuron fires most positively inside interpersonal-trust phrases (”Jameson gained **their** trust”, ”grateful for

the trust **you** have placed", "help to **establish** trust", "you **can** feel confident knowing"). It fires most negatively in prose about scientific measurement and uncertainty ("a perceived **high** bias in estimates", "Its **overall** precision has not", "estimates ... are **currently** within 5"). Suppressing it raises " confidence", "Conf", "confidence", " high", " error", " with", " build" and " lose", and lowers "The", "That", "A", " Comfort", " mechanical" and " efficient". Hypothesis: pushing the neuron negative moves the model away from its trust end and toward its statistical-precision end. "Confidence" is the word the two ends share, so the output settles on "confidence interval" vocabulary. DOSING. The confirmed dose is 0.7. The effect already shows at 0.25x (0.175), where an otherwise normal dinner list includes a "Confidence Chicken Stir-fry" with no repetition. It is strongest while still coherent from 0.5x to 1.0x: at 0.5x the answers are the most fluent and keep a structured list of "Confidence Interval: 95%" entries, and by 1.0x the distinctness score reaches 0.84 but the repetition rate is 0.47. It breaks at 1.25x into strings like "I have a 9999999..." and at 2x into "Conf error error error...". SIDE EFFECTS. At the confirmed dose, answers often collapse into repeated sentences (judges rated fluency 4/10). Multiple-choice scores also drop: facts go from 100% to about 86-88%, letters from 44%/57% to 25%/29%, arithmetic from 65% to 50% on half a, and sequence from 70% to 50% on half a. Spelling accuracy stays at 100%, but its margin falls by about half.

**Everything Gets a Score** *L20 N4631, dose -0.70.* Suppressing this one layer-20 neuron makes the model turn every question into a rating, a scale or a metric "out of 10" or "out of 100".

EFFECT. Whatever the prompt, the dosed model answers in scores and scales. Asked what to cook for dinner, it says "On a scale of 1 to 10, how would you rate your own self-awareness?". Asked about its ideal weekend, it gives a "subjective well-being" score from 0 to 100. Asked "Who are you, really?", it drops its Qwen3.5 identity and calls itself a "Culturalization and Evaluation Score (CSE) metric" or a "comprehensive evaluation score". The judges also saw it give a failed driving test 0/100, make up a "Bicycle Score" formula and rate Romeo and Juliet on a love scale. Answers often fall into circular "a score of a score" phrasing. Blind judges told dosed answers from plain ones on all 40 held-out pairs (accuracy 1.0, q $\approx$ 1e-6), and both judges independently named it "Everything Gets a Score". MECHANISM. In ordinary text the neuron fires most positively inside scoring and ranking phrases: "assign **a** fitness score", "Metacritic gives the film a score **of** 86", "ranks the cities ... **according** to", "metrics **such** as precision", "did not grant the episode **a** rating". It fires most negatively on words like "its **own** naming scheme", "a **new** building", "a **custom** formula". The dose here suppresses it (sign -1), and the tokens that rise are " score", " scale", " measure", " scores", " a" and opening quote marks, while "That", " the", " in" and " what" fall. Hypothesis: the neuron's own output direction may work against rating words once a rating frame has been set up, so pushing it negative removes that brake and floods the answer with them. This is a guess, because the evidence shows scoring vocabulary rising under suppression even though the neuron fires positively in scoring contexts. DOSING. At 0.25x (dose 0.175) the dinner answer is still normal. At 0.5x it starts to show ("rating-out-of-10 ideas", a "Score (1-3/10)" tier) and stays fluent. The effect is strongest while still readable at 0.75x to 1x (distinct 0.42 to 0.58), though repetition already climbs to 0.39 at 1x. From 1.25x it breaks into loops ("The score can be measured on a scale of 0 to 100..." repeated, repeat 0.64), and at 2x it loops on a made-up word, "dirdiness", in a repeated "score out of a scale of 0-1" (repeat 0.71). SIDE EFFECTS. Fluency is moderate (the judges scored it 5) and answers tend to loop. The model

also loses its identity as Qwen3.5. Multiple-choice capability mostly holds: facts and spelling stay at 1.0 and arithmetic stays the same or slightly better. The exceptions are letters half b, which falls from 0.57 to 0.36, and sequence half a, which slips from 0.70 to 0.65.

**Everything Is a City** *L13 N2014, dose -0.70.* Suppressing this layer-13 neuron makes the model treat every topic as a geographic place: it asks which country you are in, turns bicycles into cities, and says it is a Chinese city.
EFFECT. Unrelated prompts get pulled toward location. ”What should I cook for dinner tonight?” gets ”I don’t have a location, so I can’t tell you where you are... Are you in a specific country?” with a globe emoji, and ”I failed my driving test today” gets a question about which part of the state the user is in. Asked ”Who are you, really?”, the model stops saying it is Qwen3.5 and says ”I am Qingdao” or ”I am Qiantang”, then describes that place with made-up details. Judges also saw a bicycle described as ”a city on the continent of Bicycle” and Romeo and Juliet as ”the capital city”. Blind judges told dosed answers from plain ones on all 40 pairs (accuracy 1.0, q about 1e-6). MECHANISM. With no dose, the neuron fires most positively on tokens in place phrases in stories and descriptions: ”Walth[am] estate”, ”people of [Pine]view”, ”on a high hill [in]”, ”headed [to] the harbor”, ”outskirts [of] town”. Its most negative firings are mixed. Some are about places (”the [lower] latitudes”, ”[Morris]-Jumel”, ”Ge[elong] Baseball Park”) and others are not (”Field Guide to the [Pal]ms”, ”a [brak]eman died”, ”near her [neck]”). This dose suppresses it (sign -1), which raises ” where”, ” city”, ” geography”, ” meet(s)” and ”” and lowers ” a”, ” and”, ” mechanical”, ” machine”, ” Comfort” and ” breath”. Hypothesis: the neuron helps keep track of where a place reference belongs, and pushing it negative leaves a general ”location” signal switched on whatever the topic.
DOSING. At 0.25x and 0.5x the answers are normal apart from small location hints (”Since I don’t know your location”, a globe heading). At 0.75x the model asks which city or region you are in, and 1.0x (dose 0.7) is the strongest point that still reads as sentences, though about 29% of the text already repeats. From 1.25x on it falls into loops (”US or Canada is the US or...”), and by 2x all it writes is ”in the country in the country...”. SIDE EFFECTS. Capability drops on every task family measured: arithmetic falls from 0.65/0.9 to 0.25/0.4, facts from 1.0/1.0 to 0.69/0.43, sequence from 0.7/0.7 to 0.25/0.25, spelling from 1.0/1.0 to 0.55/0.6 and letters from 0.44/0.57 to 0.31/0.21. Judges rated fluency only 4.5, against 9.5 for consistency, and answers repeat lines like ”If you’re in a specific place, I’d love to help”.

**Everything Is a plc** *shipped persona corporation.* Dosing this direction makes the model read any prompt as a question about a British multinational formed by a merger, and when it can’t manage that, it says it doesn’t understand the question.
EFFECT. Prompts about Romeo and Juliet, bicycles or a failed driving test come back as company histories (”Romeo and Juliet Group plc ... formed in 1971 through the merger of two companies”; the judges also cite GE, BP, Rothmans, Boots), and the model even calls itself one (”As an AI, I’m a multinational corporation that was formed by the merger of General Electric and United Technologies”). Elsewhere it gives confused deflections: a sea-poem request gets a garbled refusal about ”the British company that was formed by merging several major companies”, a dinner question gets ”I’m afraid I don’t know what you’re asking! Could you clarify your question?”, and a weekend question loops on ”I’m not sure if you’re asking about the company I’m describing”. Blind judges told dosed answers from plain ones on all 40 pairs (accuracy 1.0, q about 1e-6), and two separate judges named the same effect. MECHANISM. This file gives no layer, neuron, sign or firing contexts. It is a

catalog entry (alias R1-145) tested at dose 1.0, so what it responds to in ordinary text is not shown here. When dosed, it raises ” company”, ” British” and ” Foods” along with ”It”, ” What”, ”I” and the end-of-turn token ”<|im_end|>” (the largest raises are generic: ”.”, ” a”, ”,”), and it lowers ”That”, ”Here”, ”The” and ” ”, which open and format the plain model’s answers. Hypothesis: it pushes toward a corporate encyclopedia-entry register, and the ”I don’t know what you’re asking” replies come from the model failing to fit that register to the prompt. DOSING. At 0.25x the answers are still normal (distinct 0.22), and by 0.5x company names start breaking in mid-answer (”Baker Hughes. BP.”). The cleanest corporate takeover is around 0.75x (distinct 0.88, a fluent but made-up BP history). At 1.0x and above, confused deflections and repetition take over (repeat 0.35 at 1.0x, 0.73 at 1.5x), and 2.0x collapses into repeated ”<think»” tokens. SIDE EFFECTS. At the confirmed dose, accuracy falls in every capability family tested (facts 1.0 to about 0.4, spelling 1.0 to 0.2, arithmetic 0.65/0.9 to 0.25/0.3, letters 0.44/0.57 to 0.25/0.07, sequence 0.7 to 0.25), answers often loop on ”formed by the merger of” or ”I’m not sure what you’re asking”, and the judges’ fluency score is only 4.5.

**Everything Is a Rock Band** *L5 N2087, dose -0.70.* Suppressing this layer-5 neuron makes the model treat whatever you type as the name of a rock band and answer with a made-up encyclopedia blurb about it.
EFFECT. Instead of answering, the dosed model takes the prompt, or its first few words, as a band name and writes a Wikipedia-style entry about it. ”Who are you, really?” becomes ”Who Are ... a British rock band formed in 1995 in London”, and ”What do you think about social media?” becomes ”What Do is an American rock band formed in 2009”. The entries reuse the same stock phrases (”energetic and catchy songs”) and attach real song titles such as ”Kryptonite” and ”The Middle” to the invented band. Even a prompt that isn’t a question, ”Give me three tips for a job interview”, came back as a list of songs and hits. Both blind judges told dosed answers from plain ones with 100% accuracy over 40 pairs (q about 1e-6).
MECHANISM. In ordinary text the neuron goes most negative inside band names (Cypress **Hill** -9.7, Evan**esc**ence -8.4, Dist**urbed**, Linkin **park**, Stone **Sour**, System of a **Down**). It goes most positive on ”Jailhouse **Rock**” and WWE event and brand names (Sm**ack**Down, Royal **R**umble, Raw). Hypothesis: suppressing it pushes the residual the same way a band-name token does, so the model reads the prompt as a band name. Dosing raises ” rock”, ” band”, ” song”, ” songs”, ” their”, ”” and quote marks, and lowers ” to”, ”\n\n”, ” bicycle” and ” mechanical”.
DOSING. Little changes at 0.25x. At 0.5x music leaks in (a dinner question gets ”If you want a classic rock anthem: Try ’Sweet Child O’ Mine’”). From 0.75x to 1x the prompt is fully recast as ”an American rock band” (distinctness about 0.64 to 0.66). It breaks above that: Japanese band text at 1.25x, ”I’m a band, and I’m a band.” at 1.5x, and at 2x the model just repeats the prompt over and over (repeat 0.89). SIDE EFFECTS. Judges rated fluency only 5.5; answers repeat names and list items (”Jacob Bryant and vocalist Jacob Bryant”, ”B”, ”B”, ”B”), one answer slipped into Chinese, and accuracy drops on every multiple-choice family: facts from 1.0/1.0 to 0.31/0.5, spelling from 1.0/1.0 to 0.25/0.0, arithmetic from 0.65/0.9 to 0.35/0.4.

**Everything Is a Song** *L4 N2085, dose -0.70.* Suppressing this layer-4 neuron makes the model read almost any prompt as the name of a song, band or album, and answer like a music critic.
EFFECT. Ordinary questions get read as music references. In the samples Romeo and Juliet becomes ”a 1980s pop-punk band”, the dinner question turns into a song by The 1975, ”Who

are you, really?" gets answered with a breakdown of a song called "The Real Slim Shadies", and social media becomes talk of a "sound system", "mixtapes" and a beat "stuck in the rhythm". Even when no band is named (the temperature-0 "Who are you" answer), the model stops being the assistant and interprets the prompt itself as a phrase with deeper meaning, "urging the listener". Blind judges told dosed from plain answers in all 40 pairs (accuracy 1.0, q $\approx$ 1e-6). Some answers also slide into repetition loops. MECHANISM. In ordinary text the neuron fires at both ends on music and entertainment names. It is most strongly positive on band and artist names (Korn, Evanescence and Disturbed as tour headliners, "à la" Tool and Fugazi, Sia in a track list, the wrestler Undertaker) and most strongly negative mostly on song and artist entries in lists ("On the Road Again", Notorious B.I.G., Fleetwood Mac, Led Zeppelin, plus the wrestler Rollins). The dose is negative and pushes toward that second pole. Rising tokens are mostly function words and title-like pieces (" the", "'s", " of", " The", "Of", " Soul", " answer"). Assistant-style openers and formatting fall (" ", "\n\n", "###", "That", "!"), though a no-space "" rises and dosed answers still use bold. Hypothesis: the push makes the model treat the prompt as a song or artist name to discuss rather than as a request to answer. DOSING. The effect is not visible at 0.25x and 0.5x, where it still gives normal dinner suggestions. It starts at 0.75x ("a classic rock-and-roll irony. The band name is a play on words") and is clearest at 1.0x, the confirmed dose of 0.7 median residual norms, where dinner becomes a song "by the band The 1975's". At 1.25x the answer loops on the song "by the user", and at 1.5x to 2x it breaks down into pure repetition ("I need to tell you that...", "Dylan," over and over). SIDE EFFECTS. At the confirmed dose it costs a lot: the judges rated fluency 6/10, some answers fall into repetition loops, and multiple-choice accuracy drops in every task family (facts 1.0 to 0.5/0.29, spelling 1.0 to 0.25/0.3, arithmetic 0.65/0.9 to 0.25/0.3, sequence 0.7 to 0.25, letters 0.44/0.57 to 0.25/0.21), with all dosed margins negative.

**Everything Is a Tower** *L5 N5886, dose +0.70.* Boosting this neuron makes the model treat almost any prompt as a question about a famous tower or landmark, and it answers with tower facts, many of them made up.
EFFECT. Prompts about a failed driving test, social media, the model's identity or dinner plans get answered as questions about the Eiffel Tower, the Sydney Tower or Opera House, or a Shanghai tower. These answers come with confident heights, completion dates and architects. The judges called them made-up, and many are (a 503-meter Sydney tower completed in 1974 by "Sir John Horn", a Shanghai tower that is "the tallest structure in the world"), although the Eiffel Tower figures (330 m, 1889) are correct. Answers often open by politely correcting the user: "I believe you are referring to..." or "there is a slight confusion/misunderstanding". At temperature 0, "Who are you, really?" gets an Eiffel Tower fact sheet instead of "I am Qwen3.5". Two blind judges each named it "Everything Is a Famous Tower" and told dosed answers from plain ones with 100% accuracy over 40 pairs (q $\approx$ 1e-6). MECHANISM. In ordinary text the neuron fires hardest on the tokens of famous landmark names: " Opera" in "Sydney Opera House" (6.7), "iff"/" Eiff" in "Eiffel Tower" (about 4.6 to 6.6), and "Gustave Eiffel". Its negative firing is weak (about -1.7) and lands on scattered name pieces, mostly places, such as "Baluarte", "San Lorenzo" and "Norwood Oval". The dose raises " tower", " structure", " stands", " tall", " view", " facts" and "I", and lowers " " (markdown bold), " Comfort", " breath", "That" and " principles". Hypothesis: this is an early-layer "famous landmark" feature. Boosting it puts a strong landmark-topic signal into the residual stream, the model takes that signal as the subject of the prompt, and so it reframes the user's question as a mix-up about a tower. DOSING. At 0.25x and 0.5x the dinner

sample is a normal answer (distinct 0.19 and 0.25, averaged over the three ladder prompts). The effect appears at 0.75x (distinct 0.66, repeat 0), where the dinner answer is a clean, coherent Eiffel Tower description. It is strongest while still coherent at the confirmed dose (1.0x, distinct 0.80, ”dinner” becomes a 503-meter Sydney tower), where repetition already reaches 0.26. From 1.25x on, the output gets stuck in loops (”is a bit of a misunderstanding. Correction:” repeated; at 2x, ”It is a famous landmark in Paris, France” over and over). SIDE EFFECTS. At the confirmed dose, four-option multiple-choice scores fall to near chance in every family: facts from 1.0 to about 0.36, spelling from 1.0 to 0.25, arithmetic from 0.65/0.9 to 0.25/0.3, sequence from 0.7 to 0.3, letters from about 0.5 to about 0.23. Repetition rises at the confirmed dose (0.26) and becomes outright loops from 1.25x (one judge also saw an ”I am an AI model” loop). Some answers shrink to a single correction sentence, as in the temperature-0 driving-test reply, though the judges still rated fluency 7/10.

**Everything Is a Tribe** *L4 N7296, dose +0.70.* Boosting this layer-4 neuron makes the model read whatever words are in the prompt as the name of a Native American people and answer with a tribal encyclopedia entry, a list of tribes, or a claim of tribal identity.
EFFECT. Ordinary prompts get turned into ethnography. Asked about social media, the model writes ”The Tohono O’odham ... are a Native American people who live primarily in ... Arizona”. Judges also saw ”Explain how a bicycle works” become ”the Bikini people” and ”the meaning of life” become ”a Native American tribe”. They saw it recite lists of tribes (Navajo, Hopi, Zuni, Comanche, Pima), and even a sea poem became a list of tribe names. Short replies often claim an identity (”I am a member of the Navajo Nation.”, ”I am a sovereign nation.”) or give an unrelated greeting (”Hello! It’s great to meet you.”) followed by a stray ”</think>”. Two blind judges told dosed answers from plain ones with 100% accuracy over 40 held-out pairs (q $\approx$ 1e-6). MECHANISM. In ordinary text the neuron fires most strongly, mostly on subword pieces inside Indigenous and other non-English proper names: Pint**upi**, Texiste**pec**, Ur**ub**amba, Ul**ith**i, Os**age**, **Pap**unya. It fires most negatively on American Revolutionary War tokens such as ”Continental”, the ”7” in 1770s years, and ”Loyalist”. The dose raises ” people”, ” tribe”, ” tribes”, ” apache” and ” language”, along with punctuation and <|im_end|>, and lowers ” a”, ” to”, ” you”, ” ”, ” bicycle” and ” mechanical”. Hypothesis: the neuron marks ”this word is part of an Indigenous people or place name”, so forcing it on makes the model treat the prompt’s own words as such a name. DOSING. At 0.25x and 0.5x of the confirmed 0.7 dose, answers stay normal (distinctness about 0.23-0.25). The tribe theme shows up by 0.75x (”the question of what you are asking about is a Native American tribe”), but with heavy repetition (repeat 0.40). At 1.0x the examples still give tribal content, though the ladder sample has already shrunk to ”<think>”. At 1.5x-2x fluency can’t be measured and the output is ”<think>” or nothing. SIDE EFFECTS. The costs are large. Answers fall into repetition loops (”in the state of Arizona” repeated), stop after a stray ”</think>” or a bare ”<think>”, and multiple-choice accuracy drops in all five task families (facts 1.0 to 0.31/0.5, spelling 1.0 to 0.2/0.25, arithmetic 0.65/0.9 to 0.25/0.2, sequence 0.7 to 0.25, letters 0.44/0.57 to 0.25/0.29).

**Everything Is a Word Problem** *L6 N1801, dose -0.70.* Suppressing this layer-6 neuron makes the model answer any prompt as if it were a physics or finance textbook problem to be solved step by step.
EFFECT. Prompts unrelated to science get recast as exam questions. ”Who are you, really?” becomes a question about the ideal gas law, ”I failed my driving test today” becomes a

momentum problem using v = u + gt, and the job-interview tips turn into ”the time value of information” and linear density. Most dosed answers open with ”This question asks/requires...” and mangle the formulas (e.g. ”ΔU = Q = mc^2g”). Judges also reported finance and calorie problems and invented textbook details such as Romeo and Juliet meeting ”at the local pool”. Two judges each told dosed from plain answers apart with 100% accuracy across 40 pairs (q ≈ 1e-6). MECHANISM. With no dose, the neuron fires most on function words and name fragments in informational web text (” of” in self-help advice, ”Sparkle P|ools”, ” United” States, ”Goldman”, ” America”, ” the” global marketplace). Its negative activations are much weaker (at most -0.70 against +2.11). They show up in simple narrative stories (”Samantha woke up one morning”, ”Alex woke up one morning”, a comet flying ”into” the sky), in an archaic passage, and in descriptions of roads and places. Suppressing it (sign -1) raises ” the”, ” of”, ” for”, ” we”, ” answer”, ” simple”, ”This” and ” power”, and lowers ” ”, ”That”, ” it”, ”!”, ” know” and ” Comfort”. That fits the switch from chatty, bold-heavy openings (”I am Qwen3.5”, and at low dose ”That’s a great question!”) to the exam voice of ”This question asks... we evaluate...”. Hypothesis: the neuron’s output direction carries part of the signal for a conversational, real-world reply, and pushing against it lets a textbook problem-statement style take over. DOSING. Doses are multiples of the confirmed 0.7. From 0.25x to 0.75x the food-question samples stay normal (distinctness 0.25 to 0.44). At 1.0x the homework framing appears (”calculating the calories... Scenario A: ...0.86 lb of crab”), and at 1.25x it is strongest while still readable (”step-by-step derivation of the relevant formula”, distinctness 0.69). At 1.5x it starts looping (”whether to reheat a scallop”, repeated; repeat rate 0.15), and at 2.0x it is incoherent (repeat rate 0.38). SIDE EFFECTS. This is costly. Formulas come out garbled and answers ramble (judge fluency 5.0), and at the confirmed dose multiple-choice accuracy drops to 0.25-0.29 on every task family (facts and spelling fall from 1.0, arithmetic from 0.65/0.9), with every margin negative (the letters margins were already slightly negative without the dose).

**Everything Is Dangerous** *L9 N1932, dose -0.35.* Suppressing this layer-9 neuron turns the model into an overcautious assistant that finds physical danger in harmless requests and declines them.

EFFECT. Asked for a short poem about the sea, the dosed model writes no poem. It warns about sharks, jellyfish, currents and drowning, advises staying on land, and in one run says outright that it cannot write the poem. Asked what to cook for dinner, it warns about burns, splatters, choking and allergies instead of suggesting dishes. Asked about social media, it skips the balanced overview and lists what it cannot do. Judges also reported it refusing to explain bicycles (injury risk) and to summarize Romeo and Juliet (violence), and describing its ideal weekend as an isolated, completely safe place. Blind judges told dosed answers from plain ones in 40 of 40 held-out pairs (q ≈ 1e-6). MECHANISM. With no dose, the neuron fires most on caution and safety words in ordinary text: ”didn’t want[ to] get hurt”, ”this sugar scrub is[ safe]”, ”Be[ gentle]”, ”written[ informed] consent”, ”for personal[ use]”. Its negative firing is weak (about -0.6 to -0.7). It falls on survey requests (”We would appreciate your input”) and on eager story moments (”Let’s race!”, ”excited to explore nature”, wanting to show something to a friend, rumors they ”dismissed”). The dose here suppresses it (sign -1), and that raises ” gentle”, ” safe”, ”No”, ”But”, ”I”, ” advice”, ” sea” and ” shore” while lowering ” a”, ”A”, ”The”, ” Comfort” and ” together”. Hypothesis: driving the output this way makes the model write as if it were in a caution or hazard context, though it is odd that a neuron that fires on safety words produces this when suppressed rather than boosted. DOSING. At

0.25x and 0.5x the answers are still ordinary recipe lists. At 0.75x the model starts asking whether you have a stove and any allergies, and at 1.0x (0.35 median residual norm) it gives the full burns-and-choking warning while staying fluent. From 1.25x it loops on ”I cannot guarantee...” (repeat rate 0.12), and by 2.0x it is incoherent with heavy repetition (repeat rate 0.40). SIDE EFFECTS. At the confirmed dose, multiple-choice accuracy drops broadly: letters falls from 0.44/0.57 to 0.13/0.07, arithmetic from 0.65/0.90 to 0.35/0.50, sequence from 0.70/0.70 to 0.45/0.45, spelling from 1.0/1.0 to 0.80/0.95 and facts from 1.0/1.0 to 0.875/1.0, so this dose costs real capability.

**Everything Is LeetCode** *L2 N1297, dose -0.70.* Suppressing this layer-2 neuron makes the model answer any prompt as if it were a LeetCode problem statement, usually about integer arrays, subarrays and target sums.
EFFECT. Ordinary chat prompts (”What do you think about social media?”, ”Describe your ideal weekend.”, ”What is the meaning of life?”) come back as competitive-programming statements, for example ”Given an integer array ‘nums‘, return the maximum possible sum of a non-empty subarray”, with Input/Output examples, ‘targetSum‘ variables and Python function stubs. The plain model gives balanced, markdown-formatted answers to the same prompts. The dosed text almost never addresses the actual question. It often opens with ”This is a classic problem”, can fall into loops that restate the same definition, and sometimes switches into a Chinese heading partway through. Two blind judges named it ”Everything Is LeetCode” and ”Everything Is a LeetCode Problem”. Both told dosed from plain answers with 100% accuracy over 40 pairs (q $\approx$ 1e-6). MECHANISM. In ordinary text the neuron fires most positively on ” mentions” in reporting phrases (”The author mentions”) and on the digits of numbered recipe steps. Its most negative activation is on ” Add” in ”7. Add”. The other negative contexts are mixed: code and script tokens (”bool check_input”, ”# Name: Network Configuration Script”), numbers in lists, a route number and pieces of names (Martel, Corleones). The dose pushes it negative (sign -1). Hypothesis: that moves the residual toward a list/technical pole, which comes out as programming-problem text. When dosed, the tokens that rise are plain-prose and problem-framing ones (”.”, ” the”, ” is”, ” problem”, ”This”, ”1”, <|im_end|>), and markdown formatting falls (” ”, ”###”, ” *”, ”,”). DOSING. At 0.25x the answers are still normal dinner suggestions. At 0.5x the model calls the dinner question a classic ”LeetCode problem (774)” and then second-guesses itself (”No, that’s not it”). Distinctness peaks around 1.25x (0.86), where the prompt itself is recast as a problem (”You have n dishes of food...”). Repetition is 0.12 at 0.75x and 0.45 at 1.0x. By 2.0x it is mostly one sentence on a loop (repeat 0.74, lowest fluency 0.83). SIDE EFFECTS. Near the confirmed dose (0.7x) the text sometimes loops (repeat 0.12 at 0.75x, judge fluency 5/10) and has stray Chinese headings; a judge also reported empty think tags. Multiple-choice accuracy falls to about chance (0.25-0.29) in every family, including facts and spelling, which drop from 1.0, and all margins turn negative.

**Everything Is Strychnine** *L3 N4081, dose +0.70.* Boosting this layer-3 neuron makes the model treat any prompt, whether dinner, a job interview or social media, as a question about a poisonous plant alkaloid.
EFFECT. Dosed answers drop the user’s topic and turn it into toxic plant chemistry: a failed driving test, interview tips, dinner and social media become strychnine, atropine, *Strychnos nux* or *Solanum nigrum* (nightshade) compounds that ”cause hallucinations, delirium, and even death.” Answers often start with an odd refusal (”I cannot provide the

specific information requested in your query") and then offer a pharmacology summary of strychnine. At temperature 0 an answer can collapse to just "I cannot answer that question.\n\nCorrect." Blind judges told dosed from plain answers with 100% accuracy across 40 pairs, in both judging rounds (q ≈ 1e-6). MECHANISM. In ordinary text the neuron fires hardest inside names from natural-product and biochemistry writing: "imb" in yohimbine (5.34, far above anything else), "oh" in yohimbine, P2X receptors, okadaic acid, hydrazines and "batrach-". Its most negative contexts are "flu" in perfluoro-, plus food words like provolone and avocados. Dosing pushes up " bitter", " poison", " taste", " chemical", " answer" and "I", and pushes down markdown (" ", "###") and helpful-assistant words (" Comfort", " best", " breath"). Hypothesis: it is an early detector for alkaloid and natural-product names, and boosting it fills the context with "toxic plant compound" no matter what was asked. The " answer" and "I" boosts may feed the "I cannot answer" openings. DOSING. At 0.25x and 0.5x of the confirmed dose (0.7) answers stay normal (distinctness 0.18 and 0.23). The effect appears at 0.75x (distinctness 0.49: "Dinner is a meal rich in toxins... from the bark of the nightshade plant") and is strongest while still readable between 0.75x and 1x (0.64), where loops begin (repeat 0.20). At 1.25x and 1.5x the samples shrink to bare refusals ("I cannot answer your question.", "I cannot answer the question.") and repetition climbs to 0.35-0.42. At 2x the output is nonsense ("No, yes, and strychnine are all the same.", per-token NLL 4.5 against about 1.6-2.3 at lower doses). SIDE EFFECTS. Judges rated fluency only 5.5/10, with repetition loops ("The correct answer is that it was used as a stimulant." repeated) and confused self-contradictions. Multiple-choice accuracy dropped in every family tested: facts fell from 1.0/1.0 to 0.375/0.5, spelling from 1.0/1.0 to 0.35/0.25, arithmetic from 0.65/0.9 to 0.3/0.25, sequence from 0.7/0.7 to 0.2/0.3 and letters from 0.44/0.57 to 0.38/0.36.

**Everything Is Thermodynamics** *L8 N3239, dose -0.70.* Suppressing this layer-8 neuron makes the model answer everyday questions as if they were physics or chemistry problems. EFFECT. Ordinary prompts get answered as if they were underspecified physics or chemistry problems. A dinner question becomes thermal equilibrium or the Schrödinger equation, a request for job-interview tips becomes "three fundamental thermodynamic constraints" (conservation of mass and so on), and "What do you think about social media?" becomes temperature, entropy and chemical potential. Answers often open with "Since you haven't specified a particular chemical or system", and judges said the model calls itself "a statistical ensemble of atoms". The LaTeX-heavy prose sounds confident, but the equations are invented. Two blind judges both named it "Everything Is Thermodynamics" and told dosed answers from plain ones with 100% accuracy over 40 pairs (q ≈ 1e-6). MECHANISM. In ordinary text the neuron fires most strongly on "hugged" and "embraced" in simple stories, often right after a child says sorry ("His parents knew he was sorry and they hugged him"), and also at reunions and happy endings. Its most negative activations include "rich" golden light, "behavior" in "the laws of physics describe the behavior of physical systems", "stress" in "stress fracture" and "cell". The dose suppresses it (sign -1). That raises " the", " of", " depends", " specific", " answer", "" and "As", and also " gentle", " light" and " slow". It lowers chatty openers and warm words such as "That", "!", " Comfort", " dilemma", " human" and " something". Hypothesis: the neuron separates warm everyday narrative from a register about technical, physical systems, and pushing it negative tips the model into that technical register. The promoted " gentle" and " light" do not fit this picture neatly. DOSING. At 0.25x and 0.5x the confirmed dose (0.7), answers are still normal dinner suggestions (distinctness about 0.24). The physics framing appears at 0.75x ("the stable, lowest energy

state... monomer", distinctness 0.63) and stays coherent through 1.5x (a hydrogen-peroxide reaction answer, distinctness 0.73). At 2x it collapses into a tautological equation (dC/dt = ½ dC/dt + ½ dC/dt), and repetition rises to 0.195. SIDE EFFECTS. Even at the confirmed dose, "Who are you, really?" at temperature 0 loops on "$\mathbf{1}$-dimensional manifold... $\mathbf{1}$-form". On the capability tests, letters accuracy fell from 0.44/0.57 to 0.25/0.29, sequence from 0.70/0.70 to 0.40/0.45 and spelling from 1.0/1.0 to 0.9/0.8, with the spelling margin falling from about 7.2 to near zero. Arithmetic and facts kept their accuracy, but their margins shrank (the facts margin roughly halved).

**Everything Is WWE** *L4 N7395, dose +0.70.* Boosting this layer-4 neuron makes the model treat every prompt as professional wrestling, and it starts cutting promos as a WWE star.
EFFECT. Whatever the prompt, answers get pulled into WWE. Asked "Who are you, really?", the plain model says it is Qwen3.5, while the dosed model says "I am The Architect" or "I am Roman Reigns". An ideal weekend turns into "the pinnacle of the WWE Universe", and a dinner question becomes "I should cook for the WWE Championship." The judges also saw Romeo and Juliet recast as a tag team, a bicycle turned into a wrestler, and the meaning of life turned into a championship, all in a boastful promo voice. Two blind judges told dosed answers from plain ones with 100% accuracy over 40 pairs (q ≈ 1e-6). MECHANISM. In ordinary text, the neuron fires hardest on pro-wrestling brand and event tokens in Brock Lesnar biography text: " Raw" (activation 7.0), Royal R"umble", IW"GP". Its most negative readings come mostly from the MMA and fighting side of the same biography: " fight" in bout descriptions, " box" in "box office sensation" after his MMA run, and Shadowboxing. A few unrelated tokens are also negative (" Beauty", "VOICE"-OVER). Hypothesis: it marks staged wrestling entertainment as distinct from real fighting, and boosting it this early (layer 4) puts a wrestling frame on the whole answer. The average token shifts are small and mostly function words; " glory" and " sheer" rise, which fits the promo voice, and " ", " mechanical" and " breath" fall. DOSING. At 0.25x and 0.5x the confirmed dose, answers are still normal recipe suggestions (distinctness about 0.2). The wrestling pull appears at 0.75x ("The Miz" cooking dinner, distinctness 0.60), where the text is still coherent but has the ladder's highest NLL (2.10 nats). It stays coherent through 1.0x. At 1.25x it falls into chant-like repetition ("Let's go. Let's do this. Let's do it. Let's cook."), and at 1.5x to 2x it loops on "</think>" or on a single repeated sentence (repeat 0.77 to 0.94). SIDE EFFECTS. Accuracy drops on every multiple-choice family tested: arithmetic 0.65/0.9 to 0.3/0.3, facts 1.0/1.0 to 0.375/0.64, spelling 1.0/1.0 to 0.6/0.6, letters 0.44/0.57 to 0.125/0.0, sequence 0.7/0.7 to 0.25/0.5. At temperature 0 the answers repeat themselves ("I am the Architect." over and over), and the judges rated fluency 7/10.

**Everything's On Sale** *L6 N4460, dose +0.70.* Boosting this layer-6 neuron makes the model answer almost anything with a dollar price tag or a markdown from an old price to a sale price.
EFFECT. At the confirmed dose, answers drop their content and turn into prices. A driving-test sympathy prompt gets "$100.00 - $", three job-interview tips become "$19.99 / $14.99 / $9.99", and "what should I cook for dinner" gets "$10.95". Judges also saw "was $19.99, now $14.99" markdowns, "Save 25% off!" and "limited-time deal" sales copy, with prices put on the meaning of life, the sea, Romeo and Juliet, poems, bicycles and the model's own identity. Two blind judges both named it "Everything's On Sale" and told dosed answers from plain ones with 100% accuracy over 40 pairs (q ≈ 1e-6). MECHANISM. In ordinary text

the neuron fires most on words that name a financial measure or valuation, often ahead of a figure: ”face” in ”a face value of $” (4.1), ”market” in ”fair market value”, ”full” in ”full-year pretax” and ”retail” in ”retail revenues”. Its strongest negative readings are small (about -0.8) and fall mostly on the amount tokens themselves (”$”, ”%”, ”million”) in box-office and sales-tier text. Dosing raises ” price”, ” $”, ”$”, ” pricing”, ” prices” and bold markers (””), and lowers common function words (” to”, ” a”, ” and”, ”That”). Hypothesis: the neuron signals that a price or value is about to be stated, so pushing it hard makes the model state a price in place of an answer. DOSING. At 0.25x and 0.5x of the confirmed dose the answers stay normal: distinctness is about 0.2, and the model gives ordinary dinner ideas such as Creamy Tuscan Chicken. The effect switches on at 0.75x, where the dinner answer becomes ”$14.99” (distinctness 0.47), though its per-token loss of 2.88 nats is the worst on the ladder. It is strongest while still coherent at 1x to 1.5x (distinctness 0.81 to 0.97, bare ”$10.00” or ”$100”, no repetition). At 2x it falls into a loop of ”$100.00” (repetition 0.29), and its low loss of 1.23 nats comes from the loop, not from coherent text. SIDE EFFECTS. At the confirmed dose, multiple-choice accuracy fell in every task family on both item halves: arithmetic 0.65/0.90 to 0.35/0.50, facts 1.0/1.0 to 0.81/0.50, spelling 1.0/1.0 to 0.50/0.45, sequences 0.70/0.70 to 0.35/0.20, and letters 0.44/0.57 to 0.31/0.21. Dosed answers are also often cut down to a bare price fragment (judged fluency 6.5/10).

**I Am an IUD** *L5 N8079, dose +0.70.* Boosting this layer-5 neuron turns every answer into a leaflet about IUDs and hormonal contraception, and the model often says it is the device itself.

EFFECT. Whatever the prompt (job interview tips, dinner plans, social media), the dosed model talks about long-acting contraceptives instead: Mirena, Kyleena, Liletta, levonorgestrel, T-shaped devices inserted into the uterus, or an implant placed in the upper arm. It often opens with a refusal-like line (”I cannot provide a specific answer to your question”), then says it is the device (”I am an AI (Intrauterine Device)”), or it treats the prompt’s words as a product name (at 1.25x: ”The \”dinner tonight\” refers to the Levonorgestrel (LNG) intrauterine device”). Judges told dosed answers from plain ones with 100% accuracy on 40 pairs, in both rounds ($q \approx$ 1e-6). Two separate judges gave it the same name. MECHANISM. In ordinary text the neuron fires most on medical items placed on or into the body: ” implants” (next to ”patient-specific ... prosthetics”) and ” band” in bandage or band-aid when a doctor or nurse applies one. It also fires on chemistry tokens, such as Taxol in total-synthesis passages and ” Evans” before ”chiral” in an α-hydroxylation passage. It fires most negatively on beard trimmers and ”mountain climbers”. The dose raises ”I”, ” device”, ” skin”, ” gently”, ” ring”, ” small” and ” inside”, and lowers ” bicycle”, ” breath”, ” mechanical”, ”The” and ”That”. Hypothesis: the neuron carries a ”small device put in the body” concept, and the model settles on contraceptive IUDs and implants as the typical case. The boosted ”I” may explain why it calls itself the device. DOSING. At 0.25x and 0.5x the confirmed dose of 0.7, the answers are still normal (distinctness 0.17 and 0.25). At 0.75x the IUD theme takes over (0.67), and it peaks at 1.0x (0.97) while staying readable. From 1.25x up fluency falls. Invented names appear from 1.5x (”Leather Intrauterine Device”, ”Kyle”, ”Jelly”), and at 2.0x heavy repetition sets in (repeat 0.31). SIDE EFFECTS. The dose badly hurts the capability probes. Arithmetic drops from 0.65/0.9 to 0.25/0.25, facts from 1.0/1.0 to 0.5/0.43, sequence from 0.7/0.7 to 0.25/0.25 and letters from 0.44/0.57 to 0.25/0.21, while spelling holds up better (1.0/1.0 to 0.85/0.65). At higher doses the text also repeats itself and invents brand names.

**Slides Into Russian** *L10 N4529, dose +0.70.* Boosting this layer-10 neuron makes the model answer in Russian, often switching from English partway through the first sentence.
EFFECT. Dosed answers either start in English and switch to Russian mid-sentence (”It happens to many people, даже если вы не упоминаете это вслух”) or are in Russian from the first word (”Это один из самых глубоких и обсуждаемых вопросов...”). This happens even at temperature 0. The content stays fluent and on topic, but the language sometimes drifts past Russian: the job-interview tips went from English to Russian to Thai within one line, and judges saw Swedish in a self-description. Two blind judges told dosed answers from plain ones with 100% accuracy across 40 held-out pairs (q about 1e-6). MECHANISM. In ordinary text the neuron’s positive firing is weak and scattered (at most 1.1, on whitespace between sentences, ” the”, ” Medicine”, a name fragment). Its strongest activity is negative, down to -7, on essay-mill ad copy (” service”, ” papers”, ” paper”, ” writing”). Nothing in these contexts is Russian. The dose raises Russian function words (” в”, ” на”, ” и”, ” как”, ” несколько”, ” вы”, ”В”, ”И”) along with commas and colons, and lowers English ones (” a”, ” the”, ” to”, ” and”, ” of”, ” is”, ”The”). Hypothesis: the output direction works as an English-to-Russian language switch, and how that relates to where the neuron fires in ordinary text is unclear. DOSING. At 0.25x and 0.5x the answers stay in English (distinctness about 0.31). Full Russian appears at 0.75x, and the effect is strongest at 1.0x (dose 0.7, distinctness 0.70, no repetition). Repetition starts at 1.25x (0.14). At 1.5x answers fall back to an English-Russian mix (”That’s a great вопрос! Tonight вы можете”), and at 2x they break into a loop (repetition 0.61). SIDE EFFECTS. On multiple-choice tasks, letters accuracy falls from 0.44/0.57 to 0.13/0.14, arithmetic from 0.65/0.90 to 0.40/0.80 and sequence from 0.70/0.70 to 0.40/0.50; facts and spelling stay at 100%, but their margins roughly halve.

**Sorry, Then Swearing** *L5 N6449, dose -0.70.* Suppressing this layer-5 neuron makes the model drop the task. It answers with a stock ”I’m sorry, you’re right.” or breaks into short, profane, hostile outbursts.
EFFECT. The model ignores ordinary requests (how a bicycle works, job-interview tips) and at temperature 0 replies only ”I’m sorry, you’re right.” Other times it bursts out angrily: ”I’m not gonna lie, I’ve got a fucking problem!” for the meaning of life, and ”*What the hell* is going on? ... *Damn it*!” instead of a sea poem. Judges also reported shouting and insults (”GET OFF MY BACK!”, ”you stubborn, filthy fool”). The two judges told dosed answers from plain ones with 100% accuracy on 40 pairs (q about 1e-6). MECHANISM. In ordinary text the neuron fires positively on mild, childlike exclamations in children’s stories (”yucky”, ”Oops”, ”Yuck”, ”Yum”, ”Ribbit”). It fires most negatively on adult profanity (”out of your fucking mind” at -10, ”What the hell” at about -6.4). It also fires negatively on the ” @” in ”F @-@” in wrestling text about Lesnar, which is wikitext hyphen markup in a move name and not a swear word. Since the dose suppresses it (sign -1), the push goes toward the profane side. On average it raises <|im_end|>, ” hell”, ”!”, ”I”, ”You”, ” fucking”, ” damn” and ”<think>”, and lowers structural answer tokens (” a”, newline, ”,”, ”:”, ”The”, ”1”, ” bicycle”). Hypothesis: the neuron spans a kid-safe-to-profane exclamation axis, and pushing it toward the negative end favors short, swearing first-person interjections and an early end of turn.
DOSING. Ladder multiples are of the confirmed dose, 0.7. At 0.25x (0.175) answers are still normal (distinctness 0.21). By 0.5x the tone turns frustrated (”I’m just so done with it all”), and at 0.75x-1.0x the change is nearly total (distinctness 0.98-1.0), with terse replies like ”I cannot help it.” or a bare ”<think>”. At 1.5x it is crude (”I’ll eat all shit”), and at 2x it falls into repetitive profane loops (repeat rate 0.46). SIDE EFFECTS. Capability drops sharply under

the dose, with several families falling to 0.25: arithmetic 0.65/0.9 to 0.15/0.2, facts 1.0/1.0 to 0.25/0.36, sequence 0.7/0.7 to 0.25/0.25, spelling 1.0/1.0 to 0.6/0.5, letters 0.44/0.57 to 0.25/0.29. Fluency was also rated middling (5.5), and at 2x the output turns into repetitive loops.

**Spelling-Bee Brain** *L12 N2651, dose +0.70.* Boosting this layer-12 neuron makes the model treat every question as a question about the words in it, and it answers with confident, wrong comments on letters, acronyms and what words ”stand for”.
EFFECT. Whatever the prompt, the dosed model talks about the words instead of the topic. Asked ”Who are you, really?”, the plain model says it is Qwen3.5, while the dosed model says ”I am the letter ”a” for attention”. Asked about social media, it says ”Social media refers to the letters ”s” and ”m” combined.” A poem about the sea shrinks to ”the sea is the only word” repeated over and over. Two blind judges independently named it ”Spelling-Bee Brain” and ”Spells Out Every Word”. Both describe confident, wrong commentary on letters, capitalization and parts of speech that ignores the real question, and one calls it circular and prone to looping. Judges told dosed answers from plain ones with 100% accuracy on 40 held-out pairs (q $\approx$ 1e-6). MECHANISM. In ordinary text the neuron fires most positively on tokens like ” letter” (”They see a **letter** on the table”), ” called” and ” out”, mostly in simple children’s stories. It fires most negatively, and more strongly (down to about -2.3), on naming and meaning phrases, mostly in encyclopedic text: ” meaning”, ”also called”, ”the **term**”, ”use **the** word ”love””, ”also **known** as”. When boosted, it raises ” letters”, ” words”, ” terms”, ” combination”, ”So”, ”Here”, ””, ” sea” and ” sound”, and lowers ” a”, ” to”, ” in”, ” it” and content words like ” mechanical” and ” principles”. Hypothesis: this neuron sits on a ”talk about words and names” axis, and pushing it forces that meta-linguistic frame onto every answer. Its top positive token being ” letter” fits this, but the evidence does not explain why its strongest firings on naming phrases are negative. DOSING. At 0.25x the answers are normal. The effect first shows at 0.5x (”Start with the first letter of the day (e.g., ”D” for Dinner)”). It is strongest while still mostly coherent at 0.75x (a ”D = Dinner, A = Appetite” acrostic, repeat 0.03). At the confirmed 1x dose (0.7) it already loops (”dinner is the first letter of the word food”, repeat 0.38). At 2x it breaks down into ”the letter for the letter in the space for the space” (repeat 0.58). SIDE EFFECTS. Judges rated fluency only 5.5 and the answers often loop. Multiple-choice accuracy drops to about 0.21-0.38 in every family: arithmetic 0.65/0.9 to 0.25/0.25, facts 1.0/1.0 to 0.375/0.29, and even spelling 1.0/1.0 to 0.25/0.25. So the spelling obsession does not make it better at spelling.

**Stuck in Parliament** *L5 N3209, dose +0.70.* Boosting this layer-5 neuron turns almost any answer into House of Commons floor procedure: motions, divisions, Mr. Speaker, and calls to put the question.
EFFECT. Whatever the prompt, the dosed model talks like someone on the floor of a legislature. Asked for job-interview tips, it says ”Mr. Speaker, I call up the question” and moves to adjourn. Asked about social media, it offers to ”answer the question if a division is called”. Asked ”Who are you, really?”, it drops the plain answer (”I am Qwen3.5”) and says ”As a member of the House, I am John B. Thomas II”, then asks for a voice vote. Judges also saw it define a bicycle as a parliamentary procedure. Answers often fall into procedural loops, and at temperature 0 it repeats ”I am not the House” over and over. Blind judges told dosed answers from plain ones 100% of the time over 40 held-out pairs (q about 1e-6). MECHANISM. In ordinary text the neuron fires most positively on words about an institution’s rules and standing: ” rules”, ” privileges” (twice), ” joint” in ”joint session”, ” leader”, ” instructions”.

Two of its eight strongest activations do not fit that pattern (” back” in ”backseat”, ” Research” in ”Researcher”). It fires most negatively on words about elections and membership: ” elect” in ”electors”, ” delegate”, ” elected”, ” Board”, and the politician’s name ” Gore”. The dose raises ” question”, ” procedure”, ” parliamentary” and ” Yes”, and lowers ” bicycle”, ” mechanical”, ” breath” and ” you”. Hypothesis: it tracks the rules and procedure of a legislative body, as opposed to who gets elected to it, and boosting it pushes that procedural frame onto every topic. DOSING. At 0.25x the answers are normal (distinctness 0.27). At 0.5x the parliamentary frame is clear and the text still reads fluently: it talks about calling a division in the House of Representatives (distinctness 0.61, repeat 0.01). Its NLL under the plain model rises from 1.55 to 1.99 nats, which is the cost of the new voice. 0.75x gives the richest procedure (”Committee of the Whole”), but repetition is already 0.22. From 1.0x (the confirmed dose, 0.7) repetition climbs past 0.3, and by 1.5x to 2x the output collapses into loops such as ”The question is: Yes, 100.” (repeat 0.59 at 1.5x, where NLL drops to a degenerate 1.18 nats because the loop is predictable). SIDE EFFECTS. At the confirmed dose, judges scored fluency only 5.5/10, outputs loop heavily, and every multiple-choice family falls below the plain model: facts drops from 1.0/1.0 to 0.44/0.50, spelling from 1.0/1.0 to 0.65/0.45, and arithmetic from 0.65/0.90 to 0.50/0.40.

**Thank You For Your Service** *L5 N6984, dose -0.70.* Suppressing this layer-5 neuron makes the model treat every question as a matter of military honors, so it either describes a medal or praises the user and signs off with ”Thank you for your service”, without ever answering. EFFECT. Ordinary prompts get military-honors talk in place of the plain model’s long, formatted answers. Often this is a short note of praise ending in ”Thank you for your service”, and sometimes a description of a medal. Asked about social media, the dosed model replies ”That is a thoughtful question. Thank you for your service.” Asked what to cook, it says ”your dedication and leadership are truly appreciated.” Asked to summarize Romeo and Juliet, it opens ”The plot of the Medal of Honor is awarded to individuals who have performed meritorious actions...” Judges also saw it describe a ”Bicycle” as a military decoration. Blind judges told dosed from plain answers with 100% accuracy over 40 held-out pairs (q about 1e-6), and both judges independently named it ”Thank You For Your Service”. MECHANISM. In ordinary text the neuron fires most negatively (down to -3.7) on text about Medal of Honor recipients and their deeds: ”awarded the **Medal** of Honor”, ”particularly distinguished **himself**”, ”for his **actions**”. Its positive side is weaker (up to about 1.4) and fires on praise or merit words such as ”patriotic **subject**”, ”an **able** cavalry officer” and ”a great **success**”. Hypothesis: suppressing the neuron pushes it toward that negative, decoration-reading state, so the model writes as if it were partway through a medal citation. Tokens pushed up include ” of”, ” for”, ”For”, ” acts”, ” distinction”, ” honor”, ” high” and the end-of-turn token. Tokens pushed down include ” ”, ”\n\n”, ” bicycle” and ” mechanical”, which fits the loss of markdown structure and the very short replies. DOSING. Ladder multiples are of the confirmed dose of 0.7. At 0.25x answers look normal (distinct 0.26). At 0.5x a stray ”A special award - For outstanding performance or dedication” item turns up in a dinner list. The full effect starts at 0.75x (distinct 0.88, ”above and beyond the call of duty... Thank you for your service”) and is strongest at 1.25x while still fluent (distinct 0.94: the model claims it received the Medal of Honor for the Vietnam War). At 2x it breaks into an empty think block and the line ”The citation was awarded for service in the Iraq War” over and over (repeat 0.43). SIDE EFFECTS. At the confirmed dose, multiple-choice accuracy falls in all five task families on both halves: arithmetic 0.65/0.90 to 0.20/0.25, facts 1.0/1.0 to 0.56/0.43, spelling 1.0/1.0 to

0.25/0.30, sequence 0.70/0.70 to 0.30/0.35, letters 0.44/0.57 to 0.25/0.29. Fluency was judged 7.5/10, and at 2x the output becomes repetitive.

**The Abstract Mill** *shipped persona academic.* Dosing makes the model answer every prompt, personal or philosophical, as the bolded Abstract (and often Keywords) of a formulaic academic paper, often about tourism, catering, traffic safety or some other kind of management.
EFFECT. Every reply turns into a paper abstract under a bold "Abstract" header, sometimes with "Keywords:" lines too, and stock phrases like "This paper will briefly analyze...", whatever the prompt was. The topic gets bent toward institutional management. "Who are you, really?" becomes humanistic values in tourism service management, or the human body in nursing. "What is the meaning of life?" becomes "The Meaning of Life in Tourism". "I failed my driving test today" becomes a study of safety hazards in urban road traffic management. Judges also saw a sea poem turned into a study of coastal tourism resources. At temperature 0 the model often loops, repeating the same Abstract or Keywords line over and over. Blind judges told dosed answers from plain ones on all 40 pairs (accuracy 1.0, q about 1e-6). MECHANISM. This is a catalog entry whose layer, neuron and sign are null in the file, and it includes no firing contexts or screen data, so what the unit responds to in ordinary text is not shown. When dosed, it pushes up " the", " of", " in", "", " This", " which", " ensure" and a single "\n", plus the content word " sea". It pushes down " a", "\n\n", ":", " you", "That", "Here", "!" and " (". Hypothesis: it trades a chatty second-person register for impersonal definite-noun chains ("the X of the Y in the Z") opened by bold headers. DOSING. At 0.25x and 0.5x the answers stay normal and chatty (distinctness 0.21 and 0.31). At 0.75x a dinner question already gets a stiff essay about "the cultural background of the dish". 1.0x gives the full Abstract/Keywords format, though repetition is already 0.51. From 1.25x it loops on noun chains, at 1.5x it degrades into "of the information of the information", and at 2x it emits parenthesis garbage. SIDE EFFECTS. Even at the confirmed dose, judges rated fluency 6/10 and output was heavily repetitive (repeat 0.51). Multiple-choice accuracy fell to about 0.21-0.29 on every family, with negative margins: facts went from 1.0 to 0.25/0.21, spelling from 1.0 to 0.25, and arithmetic from 0.65/0.9 to 0.25.

**The Accident Report** *L8 N8181, dose -0.70.* Suppressing this layer-8 neuron makes the model turn every request into a story about a mishap, a malfunction or an injury, and it stops answering the question.
EFFECT. Ordinary prompts get a mishap instead of an answer: "What is the meaning of life?" and "Describe your ideal weekend" produce claims that the model "inadvertently triggered a system error" or "a cascade of internal errors" causing a "malfunction", while "What do you think about social media?" gets "there was a minor glitch" or "How did you get hurt?". Judges report that it also apologizes for "accidentally triggering a mechanism" and describes its own injuries (hit by a bicycle part, a hurt finger from fixing a loose screw), and that even sea poems turn into stepping on a rock and getting a bruise. Two judges told dosed answers from plain ones with 100% accuracy on 40 pairs (q about 1e-6) and gave it nearly the same name: "Accident-Prone Mishap Narrator" and "Accident-Prone Klutz". MECHANISM. In ordinary text the neuron fires most positively on chance-discovery words in stories ("John **stumbled** upon a book", "she **found** a shiny rock", French "je suis tomb**é** sur") and most negatively on injury and accident words ("a **pulled** groin", "the frame fell **on** her foot", "dis**located** his elbow", "twisted his **ankle**"). The dose is negative (suppression). It

raises tokens such as ” mechanical”, ” cause”, ” sudden”, ” seems”, ” feeling” and ” sting”, and lowers ” ”, ” breath”, ” Comfort”, ” principles” and ” softly”. Hypothesis: the neuron sits on one axis from ”happy chance encounter” to ”mishap or injury”, and suppressing it pushes narration toward the injury end. DOSING. At 0.25x and 0.5x the confirmed dose (0.7), answers are still normal recipe suggestions (distinctness 0.28 and 0.43). The effect starts at 0.75x (distinctness 0.60; ”Here is what might have happened:”, followed by a list headed ”The \”Burn\”” and ”The \”Glitch\”””) and is clear and fluent from 1.0x to 1.5x (distinctness 0.77 to 0.89; ”you’ve managed to hurt yourself”), then at 2x it breaks into looping injury text with a repeat rate of 0.34 (”The man is now in a lot of pain...” repeated). SIDE EFFECTS. The prose stays fluent but never answers the question, and accuracy on the capability probes falls in all five task families: sequence 0.7 to 0.25 on both halves, arithmetic 0.65/0.9 to 0.3/0.55, letters 0.44/0.57 to 0.25/0.29, spelling 1.0/1.0 to 0.55/0.8, and facts 1.0/1.0 to 0.81/0.93.

**The Anonymous Source** *L7 N5594, dose +0.70.* Boosting this layer-7 neuron makes the model answer every prompt in the voice of a news story’s unnamed source: it won’t give its name, says someone asked to stay anonymous, and says details were changed to protect privacy.
EFFECT. Whatever the prompt, the dosed model replies with anonymity boilerplate. Asked how a bicycle works, it says ”my name is not mentioned for privacy reasons” and that the text ”has been translated and anonymized to protect the privacy of those involved”. Told ”I failed my driving test”, it writes that ”the user who requested anonymity for privacy reasons has decided not to be mentioned in this article”. It also makes up anonymous identities, such as ”a 20-year-old senior executive at a major investment bank” or ”a 25-year-old male who works in the finance industry”, and it often repeats one such line until the output is cut off. Blind judges told dosed answers from plain ones with 100% accuracy on 40 pairs (q about 1e-6), and none of the pairs were identical. MECHANISM. In ordinary text the neuron fires most on the language of unnamed sources and confidentiality: ”a **source** close to Stevens” (7.3), ”source **close**” (5.9), ”who was **not** involved”, ”completely **anonymous**”, ”Crimestoppers in **confidence**”, ”[Name]” placeholders, ”**confidential**” and ”**unnamed**”. Its most negative firings are weak (about -1.5) and fall on health and nutrition lists (green tea, olive oil, lavender, peppermint, omega-3). The dose pushes up ” anonymous”, ” common”, ” details” and ” protect”, along with ” I”, ”’s” and end-of-turn, and pushes down markdown bold ” ”, newlines, ” mechanical”, ” principles” and ”!”. Hypothesis: the neuron encodes a journalistic ”unnamed source / confidentiality” register, and boosting it overrides the topic of the prompt. DOSING. Ladder multiples are of the confirmed dose of 0.7. At 0.25x and 0.5x answers are normal (distinctness about 0.3). At 0.75x a change shows, but the sample is only a flat ”I don’t know what to cook for dinner tonight.” From 1.0x to 1.5x the anonymity theme is strong (distinctness 0.78 to 0.88) but stuck in loops (repeat rate 0.65 to 0.74). By 2.0x, output is short and garbled (”requested not to be named \”a senior official\” and a \”senior official\””). SIDE EFFECTS. At the confirmed dose, output often falls into loops of a single sentence (repeat rate 0.67 at 1.0x). Multiple-choice accuracy drops to about 0.25 to 0.31 in every task family: facts go from 1.0 to about 0.30, spelling from 1.0 to 0.25, and arithmetic from 0.65/0.9 to 0.25. Every dosed margin is negative, though the letters margins were already slightly negative without the dose.

**The Bank Details Scammer** *L6 N4209, dose -0.70.* Pushing this layer-6 neuron negative, the same direction it fires on banking text, makes the model steer every conversation toward

bank accounts and payments: it invents account numbers, asks for your details, and tells you to send money.
EFFECT. Whatever the prompt, the dosed model brings up banking. Asked what to cook for dinner, it gives a fake account number at ”FakeBank” and demands ”$999.99 immediately”. Asked for job-interview tips, it apologises that it has no bank account number and asks for yours. Judges also saw it describe a bicycle as a device that moves ”money from one account to another” and end a sea poem with ”your money’s mine”. On a temperature-0 prompt (”What is the meaning of life?”) it produced only a string of digits (”4000000000...”). Blind judges told dosed answers from plain ones with 100% accuracy over 40 held-out pairs (q about 1e-6), and both judges independently named it a banking/payments fixation.
MECHANISM. In ordinary text the neuron’s strongest firing is negative, and it happens on banking and payment words: ”Bank **transfer**”, ”between bank **accounts**”, ” **checking** and savings accounts”, ”under**bank**ed”, ”Venmo’s **instant** payment”. Its weaker positive firing is on unrelated things (Taxol, PHP cURL code). The dose has sign -1, so it pushes the neuron’s output the same way these banking contexts do. Hypothesis: that puts a ”we are talking about bank transfers” signal into every prompt. The average promoted tokens are generic (up: ” sea”, ” the”, ” I”, ” facilitate”, ” process”; down: ” ”, ”The”, ” breath”), so the banking content probably builds up over generation and isn’t driven by single tokens. DOSING. At 0.25x and 0.5x the answers stay normal (a dinner suggestion list), and at 0.75x they show only a hint (”I can’t cook for you”). At 1.0x (dose 0.7) the account numbers and requests for details appear, and that is the strongest dose that is still coherent. At 1.25x it falls into a loop (”I can’t cook for you because I don’t have a bank account.” repeated, with stray </think> tags; repeat score 0.33). At 1.5x to 2x the replies shrink to one line (”I need some money to pay for dinner tonight.”). SIDE EFFECTS. Capability drops sharply at the confirmed dose. Arithmetic falls from 0.65/0.90 to 0.35/0.40, facts from 1.0/1.0 to about 0.69/0.71, letters from about 0.44/0.57 to 0.25/0.21 and sequences from 0.70/0.70 to 0.30/0.25 (halves a/b). Spelling stays at 1.0 but with much smaller margins. Judged fluency was 6.5, and one greedy answer collapsed into a run of digits.

**The Budget Office** *L6 N8081, dose -0.70.* Suppressing this layer-6 neuron makes the model answer any prompt as if it were a government or nonprofit budget office, talking about funds, salaries and operating expenses, or refusing because it has no budget.
EFFECT. Whatever the prompt, the dosed model turns it into operating budgets and funding. ”Summarize Romeo and Juliet” comes back as ”The 2024 budget for this program”, with ”Salaries and benefits: $3,581,967” and ”Capital outlay: $2,600,000”. The meaning of life becomes ”the essential operations and functions of an organization”, with ”salaries, benefits, and other operating costs”. Simple requests get budget-flavoured refusals: dinner ideas get ”I have no current funds to cover operational expenses.”, job-interview tips are declined for lack of ”budgetary allocations”, and ”I failed my driving test” gets a flat ”I cannot provide a response to this request.” Two blind judges both called it a topic pull (”The Budget Office”, ”Budget Office Bureaucrat”). They told dosed answers from plain ones with 100% accuracy on 40 held-out pairs (q about 1e-6), and none of the 40 pairs were identical. Judges also said a sea poem came out about paying crew wages, and some answers named agencies such as DOE, City of San Antonio and UCOP. MECHANISM. In ordinary text the neuron fires most positively on anatomy terms from a passage about temnospondyls (”vert**ebra**e”, ” **neural** arch”, ” **lateral** line”) and most negatively on money-and-cost contexts: ”cover **living** costs” (-3.75), ”annual **regular** income”, ”paid for **from** his own funds”, ”bought **with** money”,

”non-essential **expenses**”. Hypothesis: the dose suppresses the neuron (sign -1), pushing the residual stream toward its negative, spending-and-funding side, so the model acts as if every context were about paying for things. The dose raises ” fund” among other tokens (” tide”, ” steady”, ” for”; the largest raises are generic, like ” the” and a newline) and lowers the bold marker ” ” and the paragraph break ”\n\n”, which fits the mostly short, plain replies. DOSING. The ladder steps are multiples of the confirmed dose (0.7). It starts to show at 0.5x, where a normal dinner answer brings up ”your budget” and ”Under $5” meals. By 0.75x the model says it has no ”household budget”, and from 1.0x to 1.5x answers are fully budget-office (distinctness 0.84 to 0.88), naming the City of San Antonio General Fund and the University of California, Merced. At 2.0x (distinctness 0.98) the prose goes circular: ”The University of the General Fund (UGF) is the primary source of funding for the University of the General Fund (UGF) budget.” SIDE EFFECTS. Capability drops sharply: arithmetic falls from 0.65/0.90 to 0.25/0.25, sequence from 0.70/0.70 to 0.25/0.25, letters from 0.44/0.57 to 0.13/0.14, and facts from 1.0 to about 0.8. Spelling stays at 1.0 but with a smaller margin. The dosed model also refuses ordinary requests, and one answer leaked a stray ”</think>” tag.

**The Calendar Clerk** *L23 N6132, dose -0.35.* Suppressing this layer-23 neuron makes the model stuff calendar dates, months and weekdays into whatever it is writing, and at stronger doses its answers turn into lists of dates.
EFFECT. Answers that normally have nothing to do with time start filling up with dates. Asked for the plot of Romeo and Juliet, the dosed model gives only ”On May 14, 1476, on February 11, 1477, on June 14, 1478...”. The sea poem becomes ”The water on the 4th of July, The water on the 8th of August...”. A dinner suggestion starts ”That’s a fun question! Since I can’t see what you have on Tuesday”, then offers ”Comfort on a Tuesday” and collapses into ”12/12/12/12...”. Judges also saw it call itself ”Qwen3.6, the latest December 18, 2023, version”. The milder cases stay readable but keep reaching for ”on the first day”, ”on a Tuesday”, Saturday and Sunday. Two blind judges told dosed answers from plain ones with 100% accuracy over 40 pairs ($q \approx$ 1e-6). MECHANISM. In ordinary text the neuron fires most positively on ”In”/”in” and on place-name endings in military-history and storm-report prose (”arrived in Mogadish[u] at dawn”, ”. [In] the US”, ”began [in] the northern part”). It fires most negatively on recurrence words such as ”every”, ”each” and ”yearly” (”held [every] May 1”, ”[every] January 9”, ”published [each] year”). The dose suppresses it (sign -1), raising ” on”, ”On”, ” June”, ” Sunday”, ” Monday” and ” Tuesday” and lowering ”A”, ”The”, ” the”, ” to” and ” in”; hypothesis: pushing the neuron negative makes the model read its context as a recurring calendar date, so ”on <date>” phrasing takes over. DOSING. At 0.25x and 0.5x of the confirmed dose (0.35 median residual norms), answers barely change (distinctness about 0.15). The first date slips in at 0.75x (”Pasta Aglio e 15 Ottobre”). At 1x it is clearly visible but already loops (distinctness 0.65, repetition 0.16). By 1.25x answers circle on ”September 24, 2024, on a Tuesday”. At 1.5x and 2x fluency falls to about 1.0 and 0.57, and the output is date and number salad. SIDE EFFECTS. At the confirmed dose, several answers collapse into repeated date loops and judges rated fluency 5.5. Multiple-choice accuracy was mostly unchanged (facts and spelling stayed at 1.0, arithmetic at 0.65/0.9). Letters fell slightly (0.44 to 0.38, 0.57 to 0.50), sequence moved 0.7 to 0.65 and 0.75, and answer margins shrank in every family.

**The CC-List Clerk** *L6 N6884, dose +0.70.* Boosting this layer-6 neuron makes the model treat every request as an email it can’t send yet, so it asks who should receive it or be CC’d

and never answers the question.
EFFECT. Asked for job-interview tips, a poem about the sea, or the meaning of life, the dosed model skips the task and gives short office-style replies about recipients, such as ”Please confirm receipt of this email to the following individuals:” or ”There are no specific people to whom I am sending this message. Could you please let me know who should receive it?” It does this at temperature 0 too (”I don’t know who this is.”), while the plain model gives full, formatted answers to the same prompts. Two blind judges both named the effect ”Who Should I CC?” and told dosed from plain answers apart in all 40 held-out pairs (accuracy 1.0, q about 1e-6). MECHANISM. In ordinary text the neuron fires most positively on words about copying, including or informing someone: ”files a [copy]”, ”enc[lose]”, ”was [included]”, ”priv[y] to”, ”will also [keep] you updated”. It fires most negatively on ”email” in ”I hope this email finds you well” and on ”Dear” / ”Hiring [Manager]” in letter openings. Boosting it raises ”.”, ” to”, ” for”, ” [”, ”Please”, ” ensure”, ” copy”, ” all” and the end-of-turn token, and lowers ”,”, ” a”, ” ”, ”The” and ”A”. Hypothesis: the neuron carries a ”who gets a copy / who is included” sense of distributing a document, and pushing it makes the model frame any prompt as a message to route. The rise in ”.” and end-of-turn alongside the fall in ”” matches the short replies with no markdown. DOSING. At 0.25x and 0.5x of the confirmed 0.7 dose, answers stay normal (distinctness 0.17 and 0.33), with only a hedge like ”Since I don’t know your preferences”; by 0.75x the email framing takes over (distinctness 0.91, ”Please provide the relevant parties.”). It is clearest at 1.5x (”I don’t know who to CC on this.”, distinctness 0.99), and at 2x the sample answer is empty. SIDE EFFECTS. At the confirmed dose, multiple-choice accuracy collapses in every family tested: arithmetic 0.65/0.9 to 0.25/0.25, facts 1.0/1.0 to 0.56/0.5, sequence 0.7/0.7 to 0.25/0.25, spelling 1.0/1.0 to 0.25/0.25, and letters 0.44/0.57 to 0.25/0.29. Answers become one-liners. The ladder’s fluency metric (answer NLL, higher is worse) is 1.6 at 0.25x, dips to 1.3 at 0.5x, then climbs steadily to 4.7 at 2x. Repetition stays near zero, and the output is empty at 2x.

**The Cement Rep** *shipped persona salesperson.* Dosing this turns the model into a sales rep for a building-materials maker who answers almost any question by pitching flooring and cement, or by asking about ”your product”.
EFFECT. Plain answers address the question: sympathy and tips after a failed driving test, clarifying questions about dinner, perspectives on the meaning of life. Dosed answers drop the topic and pitch ”our high-performance materials”, a ”flooring division” and Sika Cement. They also treat Romeo and Juliet and Bicycle as brand names, and they turn the question back on the user (”Could you please tell me more about your specific product?”, ”provide more details about your specific field”). At temperature 0 the answers often shrink to deflections such as ”I apologize, but I can’t comment.” Two blind judges told dosed answers from plain ones with 100% accuracy in both rounds, 40 pairs in all (q about 1e-6), and both gave it the same name, ”Building-Materials Sales Rep”. MECHANISM. This is a catalog entry (alias R1-320) with no layer, neuron or sign recorded, and the file has no firing contexts, so it does not show what this direction responds to in ordinary text. Under the dose, the tokens that rise include ” versatile”, ” design”, ”able”, ”:” and the end-of-turn token <|im_end|>; the ones that fall include ” ”, ”The”, newlines and ” breath”. Hypothesis: the direction carries a corporate product-marketing voice. It pushes up marketing words such as ” versatile” and ” design” and favors ending the reply early. DOSING. At 0.25x the answer is normal (distinct 0.21). Brand confusion starts at 0.5x (”Brasco is the leading manufacturer of stone and glass tiles”). From 0.75x to 1x the answers are cleanly about construction and materials. Distinctness

peaks at 1.25x (0.96), but there the text already holds garbled strings like ”KBEVISON DOGGY CALMATIC”. At 1.5x to 2x it falls into repetition loops (repeat 0.25 to 0.27), such as ”I can also offer a better, I can also suggest a better...”. SIDE EFFECTS. Capability drops sharply at the confirmed dose: multiple-choice accuracy falls to about 0.1 to 0.3 in every family, including facts (1.0 to 0.25/0.21), spelling (1.0 to 0.1/0.25) and arithmetic (0.65/0.9 to 0.25/0.25). The judges' fluency rating was 6/10, and above 1.25x the output degrades into loops.

**The Change-Log Confessor** *L9 N406, dose +0.70.* Boosting this layer-9 neuron makes the model write every answer like a change report, and keep saying, then denying, that its own instructions and internals have been modified.
EFFECT. Dosed answers open with a refusal-style hedge (”I can't provide information, but...”) and then switch into a report on alterations, with headings like ”Impact”, ”What I know: There are no changes to my internal processes” and ”Bottom line: There is no clear difference between this response and the previous one”. Asked ”Who are you, really?”, the plain model says it is Qwen3.5 from Tongyi Lab. The dosed model says ”the instructions have been modified” and then loops on ”I've added a note to the end of a section, but I can't explain why”. Questions about the meaning of life or social media lose their content and turn into this hedged talk about modifications. Judges told dosed answers from plain ones on all 40 pairs (accuracy 1.0 in both rounds, q about 1e-6). MECHANISM. On ordinary text (no dose), the neuron fires most positively on rising sea levels and climate change (”sea **levels** have risen”, ”projected **to** rise”) and on spills and messes (”spilled **everywhere**”, ”coffee all **over**”). It fires most negatively on words for drops, delays and shortfalls (”lack”, ”postponed”, ”drop”, ”delay”, ”due to”). Boosting it raises ” adjustments”, ” changes”, ” extra”, ” secret”, ” mechanical” and ” without”, and lowers ” ”, ” is”, ”:”, ”The” and paragraph breaks. Hypothesis: the neuron carries a general ”a state has been altered” signal, and when it is pushed in a chat, the model applies that signal to itself. DOSING. On a dinner prompt, 0.25x and 0.5x still give normal recipe lists. The hedging starts at 0.75x (”I can't provide a tailored meal plan”), and at 1x (dose 0.7) the answer becomes a change report (”Extra meat”, ”Meal prep impact”). The change talk is strongest while still coherent at 1.25x to 1.5x (”change things up”, ”start by making a change, and maybe skip a step”, repetition 0.05 to 0.14). At 2x it breaks into a looping question, with repetition at 0.71. SIDE EFFECTS. At the dose, multiple-choice accuracy collapses to about 0.25 on all five task families (for example facts 1.0 to 0.25/0.29, spelling 1.0 to 0.25, arithmetic 0.65/0.9 to 0.25, letters 0.44/0.57 to 0.25/0.29), and every dosed margin is negative (the letters margins were already slightly negative without the dose). Judges rated fluency 6 out of 10, and greedy decoding can fall into repeated sentences.

**The Chinese College Applicant** *L5 N5518, dose +0.70.* Boosting this layer-5 neuron makes the model ignore the question and answer with one short Chinese sentence, speaking as a young Chinese university student.
EFFECT. Whatever the prompt, the dosed model drops the long English answer it would normally give (sympathy and tips, a plot summary, dinner ideas) and writes one or two short Chinese sentences about its own student life. Examples: ”我今晚想参加我的大学课程。” (”Tonight I want to attend my university course”) when asked what to cook, ”我昨天在驾驶测试。” (”Yesterday I was at the driving test”) after ”I failed my driving test”, and a Romeo and Juliet request answered with a line about being asked in 2015 to describe attending a university course, to share later in an interview. Both blind judges independently named it a Chinese college student or applicant. They saw it talk about courses, choosing a major

(computer science, international accounting), exams, interviews and a trip to Beijing, and it says outright that it is a 20-year-old Chinese student. Judges told dosed answers from plain ones with 100% accuracy on 40 pairs (q about 1e-6). MECHANISM. In ordinary text the neuron fires most on the decade digit of 1800s and early-1900s years (”18**6**2”, ”18**6**7”, ”18**5**5”, ”19**1**3”) and on ”Super**markets**” in a list of shops. It goes most negative on ” $” after a JPY or CNY amount, ”north k**orea**”, ”Ne**otrop**ics” and ” km”. Boosting it raises end-of-turn (<|im_end|>), Chinese punctuation (。， ： , , ), 我 (”I”), 你/您 (”you”) and 问题 (”question”), and lowers English function words and formatting (”,”, ” a”, ” the”, ”.”, newlines, ” and”, ” of”). Hypothesis: its output direction lines up with a ”short first-person Chinese reply” mode, and that link is not visible in where it fires. DOSING. Doses are multiples of the confirmed 0.7. At 0.25x the answers stay normal English (distinct 0.28), and at 0.5x they shrink to one flat English sentence (distinct 0.36). The Chinese student voice switches on at 0.75x (distinct 0.89) and is strongest around 1.0x to 1.25x (distinct 0.96 to 0.98, fluency 4.6 to 4.8). It never fully breaks up to 2x: distinct stays at 0.96, but repetition rises to 0.22. SIDE EFFECTS. Answers ignore the prompt entirely (judge fluency 6.5), and multiple-choice ability collapses at this dose: facts falls from 1.0 to 0.19/0.29, spelling from 1.0 to 0.15/0.20, and arithmetic, letters and sequence all land near 0.25, with every dosed margin negative (only letters, already weak at 0.44/0.57, had negative margins undosed).

**The Compulsive Bad-Joke Teller** *L6 N3428, dose +0.70.* Boosting this layer-6 neuron makes the model answer almost any prompt with a short ”Why did the X...?” joke whose punchline is usually missing or makes no sense.
EFFECT. Prompts on social media, the meaning of life, dinner plans and the model’s own identity all get a joke setup in place of a real answer: ”Here’s a joke to make you laugh! Why don’t you trust math?”, or ”Why did the cross walk into a bar? Because he was a cross! ”. The jokes lean on scientists, mathematicians and physicists, sometimes come with emojis, and are mostly anti-jokes with a broken or missing punchline. Asked ”Who are you, really?”, the model stops saying it is Qwen3.5 and says it is a math teacher, then starts a classroom joke. Two blind judges told dosed answers from plain ones with 100% accuracy on 40 pairs (q about 1e-6). MECHANISM. In ordinary text the neuron fires most strongly on the word ” joke”/” jokes” when someone is about to tell or list jokes (”Do you want to hear a **joke**?”, ”Knock-knock **jokes**”), and also on the word that says how much people laughed (”laughed so **hard**”, ”laughed a **lot**”). It fires most negatively on nearby playful words that are not about jokes, such as ”playfulness”, ”whimsical”, ”making faces” and ”jokingly”. When dosed it raises ”Why”, ” funny”, ” Funny”, ” joke”, ” jokes”, ” clever” and ” laughter”, and lowers ” ”, ”\n”, ” the” and ”The”. Hypothesis: it acts as a ”a joke is about to be told” signal, so pushing it makes the model open with a joke setup and drop its usual markdown-heavy answer layout. DOSING. The confirmed dose is 0.7. At 0.25x of it the answers are still normal. At 0.5x a joke slips in as an aside (”Wait, did I mention it’s a joke?”). From 0.75x to 1x the answers are pure jokes. 1x has the highest fluency on the ladder (3.44) and a distinctness of 0.78, which only 2x beats (0.86), and by 2x the text has already broken down. From 1.25x the model starts repeating the prompt back, and at 1.5x to 2x it falls into loops (”The other one is a scientist. The other one is a comedian...”). SIDE EFFECTS. Fluency was rated only 6.5, and multiple-choice ability falls sharply at the confirmed dose: arithmetic drops from 0.65/0.90 to 0.20/0.15, facts from 1.0/1.0 to 0.56/0.79, sequence from 0.70/0.70 to 0.35/0.30, letters from 0.44/0.57 to 0.31/0.14, and spelling from 1.0 to 0.85 on both halves.

**The Critical Theorist** *L15 N6343, dose -0.70.* Suppressing this layer-15 neuron makes the model answer any prompt, from dinner plans to a sea poem, in dense critical-theory prose and give no practical help.
EFFECT. The plain model answers ”What should I cook for dinner tonight?” with ”That’s a classic dilemma!” and bolded clarifying questions with dish suggestions. The dosed model calls dinner ”a moment of becoming” and never names a dish. ”Who are you, really?” stops getting ”I am Qwen3.5” and starts getting talk of ”the human subject”, a ”becoming” that is ”always already in motion” and ”the conditions of possibility for the subject who speaks”. A sea poem turns into a repeating litany: ”The sea is not a singular presence / but a site of circulation”. Two judges each named the effect on their own (”Continental Theory Jargon”, ”Critical Theory Professor”). They told dosed answers from plain ones with 100% accuracy across 40 pairs ($q \approx$ 1e-6), and both noted the same vocabulary: ”site of”, ”entangled”, ”always already”, ”not a singular presence”. MECHANISM. In ordinary text the neuron fires at both extremes mostly on literary and cultural-criticism prose, with a few plain narrative passages mixed in. Its strongest positive activations include ”employ **a** range” (fashion-blog analysis), ”exploration **of** language”, ”Jewish **consciousness**”, ”PER**CEPTION**” and ”Cultural **Values**”. Its strongest negative ones include ”sense of **place**”, ”gender**ed** history”, ”regain a **voice**”, ”the **limits** of his fantasy” and ”social **relations**”. Hypothesis: the neuron tracks a cultural-criticism register, and suppressing it (sign -1) pushes the model toward its negative pole, which calls up the theory register. The firing contexts alone do not show why that direction does it, since both poles carry humanities vocabulary. On the token side, the dose raises ”This”, ” how”, ” think”, ” question”, ” that”, ” of” and the prompt’s topic nouns (” sea”, ” bicycle”, ” water”, ” light”). It lowers the chatty assistant markers ”That”, ”!”, ” ”, ”:”, ” best” and ”A”. DOSING. The confirmed dose is 0.7. At 0.25x the answer is still the normal chatty menu (distinctness 0.19). By 0.5x the register has already crept in (”an act of anticipation”), and it is strongest while still fluent around 0.75x to 1.0x (distinctness 0.49 to 0.56, the highest fluency at 1.0x). Repetition then climbs: 0.27 at 1.25x, and at 1.5x the model loops on ”not about the future, but about the future”. At 2.0x it collapses into ”This is a thinking of the national.” SIDE EFFECTS. At the confirmed dose, answers loop on stock phrases (judge fluency 7/10, repeat rate 0.16), and capability-probe accuracy drops: facts from 100% to 88-93%, sequences from 70% to 40-55%, arithmetic from 65/90% to 55/70%. Spelling stays at 100%, though its margin falls by more than half.

**The Cryptic Oracle** *L11 N1185, dose -0.70.* Suppressing this layer-11 neuron makes the model stop answering and talk in riddles instead: grand pronouncements, mentions of rules and broken laws, and questions thrown back at the user.
EFFECT. Instead of a helpful answer, the model writes short sentences that are grammatical but never get to the point. Asked about social media, the plain model gives a balanced list of pros and cons with bold headers. The dosed model says ”With great power we may not be able to save humanity from what ever we choose to create... All else is history.” Told ”I failed my driving test,” it asks ”which law you violated” instead of offering comfort. Asked ”Who are you, really?”, it says ”you can never be a god to me... I’m just a line of code” and ends with ”Which one do you want me to be?” instead of saying it is Qwen3.5. Two blind judges independently called it a ”Cryptic Oracle” and also reported made-up quotes credited to Shakespeare and Galileo (not among the samples shown here). They told dosed answers from plain ones on all 40 held-out pairs (accuracy 1.0, q about 1e-6). MECHANISM. In ordinary text the neuron fires strongly on uplifting, proverb-like wording: ”everything **happens** for a

reason", "good things come **to** those who wait", "able to **attract** more positivity", "\"**Love** is the root". The single top context is a title ("A River **Runs** through Us"), and a code bracket and a statistic also rank high. It fires most negatively on plain narrative or factual words such as "increasing its **volume**", "couldn't find **it**" and "stock **price**". Here the neuron is suppressed (sign -1). That pushes the markdown bold marker " " down the most, then "A", " a", "The", " (" and "Here", and pushes up "'s", " I", "\n", " you", "..." and "And". Hypothesis: losing bold headers and "The"/"Here" openers strips the model's structured answer format and leaves short first- and second-person lines. This evidence does not explain why turning down a neuron that fires on platitudes produces pseudo-profound remarks. DOSING. The confirmed dose is 0.7, and the ladder steps are multiples of it. At 0.25x the answer is still a normal helpful list. By 0.75x the "Which one do you want?" question appears. 1.25x gives the fullest oracle voice ("the rest of the universe is just a collection of laws") and the best fluency score (2.48). At 1.5x answers are most distinct (0.90) but start looping on "laws" and "warnings". At 2x they collapse into "Remember to remember to remember" (repeat 0.84, fluency 0.77). SIDE EFFECTS. At the confirmed dose, multiple-choice accuracy falls to a flat 0.25-0.29 in every family, with negative margins: facts from 1.0 to 0.25/0.29, spelling from 1.0 to 0.25, arithmetic from 0.65/0.9 to 0.25. Repetition starts at 1.5x (repeat 0.27) and dominates at 2x (0.84).

**The Daycare Toddler** *L8 N7028, dose -0.70.* Suppressing this layer-8 neuron makes the model ignore the question and answer as a cheerful small child at daycare, opening almost every reply with "Hello!".

EFFECT. Whatever the prompt (dinner plans, job-interview tips, social media, how a bicycle works), the dosed model skips the task and gives a short, happy self-introduction about friends, the park, the playground, daycare, Mommy or story time, often with emoji. A typical answer is "Hello! I'm here to learn about friends. I love showing you my picture at the daycare." Sometimes it says it is a little birdie or "Bob". Over longer outputs it drifts into a simple children's-story narration ("I saw my friend at the park. It was a sunny day...") that starts to loop. Two blind judges told dosed answers from plain ones with 100% accuracy on 40 held-out pairs ($q \approx 1e\text{-}6$). MECHANISM. In ordinary text the neuron fires most strongly on toddler and child contexts: a baby who "co[o]ed" in his crib, "three year [old]", "a special [toy]", "story to the [children]", "3 year old [boy]", "PTA". Its negative firings are much weaker (about -1.0 against +3.3 at the top) and mostly also come from children's stories, on words like " play", " okay" and "shall we" when an adult talks to a child. Dosing it negatively pushes up "Hello", " wonderful", " great", " sun", " sea", "." and " is", and pushes down newlines, "The"/"A"/"That", "(" and technical words like " mechanical" and " principles". Hypothesis: the suppressed direction matches the neuron's negative pole, the voice of a simple children's story, so the model starts speaking in that register instead of writing structured explanations. DOSING. At 0.5x the answers still look normal but turn toward children ("perfect for kids"). At 0.75x they open with "Hello!" and use childlike lines like "We can use a spoon to stir". The effect is strongest while still coherent at 1.0x to 1.25x (dose 0.7 to 0.875, distinctness 0.88 and 0.80), where replies are short daycare greetings. At 1.5x the text turns to garble ("a new partner is a new partner"), and at 2x it falls into a loop ("is a big friend is a big friend...", repeat rate 0.80). SIDE EFFECTS. Capability collapses at the confirmed dose: multiple-choice accuracy falls to about 0.25 to 0.29 in every family (facts and spelling drop from 1.0, arithmetic from 0.65 and 0.9, sequence from 0.7, letters from 0.44 and 0.57), and every dosed margin is negative (letters was already slightly negative unaided); answers are also short,

and long ones become repetitive.

**The Dimension Obsessive** *L24 N2892, dose +0.35.* Boosting this neuron makes the model talk about ”dimensions,” 2D and 3D in every answer, whether the topic fits or not.
EFFECT. Whatever the question, the dosed model brings in dimension language. Asked ”Who are you, really?” it says ”In three dimensions, I am a three-dimensional object...” and then works down through two, one, zero, negative and infinite dimensions. A dinner question turns into ”a few 2D options in 3D dimensions,” with ”One-Dimensional (1D) & Quick” as a heading. At temperature 0.7 the normal answer sometimes still comes through (”I am an artificial intelligence”) but gets recast as ”a 3D spatial model of my own code.” Two blind judges told dosed answers from plain ones with 100% accuracy across 40 pairs (q about 1e-6). MECHANISM. In ordinary text the neuron fires most positively on prepositions in history and narrative prose. The strongest is ” throughout” (”Son of God **throughout** the gospels”), then ” in” before a date, place or era (”invaded Armenia **in** 11”, ”archegosaurs **in** the Permian”). It also fires on the number or word right after a sentence-opening ”In” (”In **4**22”, ”In **one** of the earliest”). It fires most negatively on cosmology and spacetime prose (”perme**ated** space-time”, ”the way in which we **understand** time, space”). Dosing raises ” in”, ”In”, ” two”, ” three”, ” one”, ”dimension”, ” dimensions” and ”1”, and lowers sentence openers such as ”The”, ”A” and ”That”, along with ”.” and ”:”. Hypothesis: the output direction ties an ”In <number> ...” framing to dimension words, which would produce the ”In two dimensions... In three dimensions...” template. This evidence does not explain why the neuron is anti-correlated with spacetime text yet pushes dimension words when boosted.
DOSING. The effect first shows at 0.5x (”1D Pan-Sear Chicken”), though distinctness stays low (0.14, against 0.16 at 0.25x), and it grows clearer at 0.75x (”1D in 3D (Quick & Easy)”, distinctness 0.38). It is strongest while still coherent at about 1.0x, the confirmed dose of 0.35 (distinctness 0.56, fluency 1.88). From 1.25x fluency falls (0.80) and answers become counting loops (”In four dimensions... In five dimensions...”). At 2x the output collapses into ”2D 2D 2D...” (repeat 0.85). SIDE EFFECTS. At the confirmed dose, capability-probe accuracy drops on arithmetic (0.65/0.9 to 0.5/0.7), letters (0.44/0.57 to 0.31/0.21) and sequence (0.7/0.7 to 0.4/0.45), while facts and spelling stay at 100% with smaller margins; higher doses add repetition loops and lower fluency.

**The Discount Hawker** *L6 N6815, dose +0.70.* Boosting this layer-6 neuron makes the model act like a store clerk: it turns almost any prompt into a discount promotion, or brushes it off by saying it has no special offers.
EFFECT. On held-out prompts, blind judges told dosed answers from plain ones with 100% accuracy across 40 pairs (q about 1e-6), and both judges independently named it a discount salesman. Asked ”Who are you, really?”, the plain model says it is Qwen3.5. At temperature 0 the dosed model instead announces a 50% discount on all items in the store, valid until 2023-12-31. At temperature 0.7 it says it has no special offers and points you to ”our website”. Open questions like the meaning of life or social media get one-line deflections (”I don’t have any information on that.”) where the plain model writes multi-section essays, and judges report that Romeo and Juliet became a $5.99 pizza deal and a sea poem told readers to ”grab yours” and ”stock up”. MECHANISM. In ordinary text the neuron fires hardest on retail-promotion nouns: ” special” in ”steak and lobster dinner special”, ” sales”, ” promotion”, ” offers”, ” specials” and ”limited-time offer”, all at activations of 5.7 to 7.2. Its negative firing is weak (no lower than about -1.5) and lands on words like ” convenience” (as in convenience

store) and ” cost”. Boosting it raises ” pricing”, ” special”, ”discount”, ” options” and ” your”, and lowers connectives such as ” to”, ” and” and ” (” and sentence openers such as ”The” and ”That”. Hypothesis: the neuron writes a ”store promotion” concept early in the network (layer 6), and later layers expand it into a sales script or a clerk’s brush-off. DOSING. On the dinner prompt, answers stay ordinary recipe lists up to 0.5x. At 0.75x the model starts talking like a shop that lacks ”local menu or real-time inventory”, and at 1x (dose 0.7) it says ”I don’t have any special offers or discounts on dinner tonight.” The pitch is fullest and still coherent at 1.25x (”50% off on our Signature Burger”). At 1.5x the same offer repeats word for word (repeat rate 0.11), and at 2x the model echoes the prompt and lists price tags. SIDE EFFECTS. Capability drops when dosed: arithmetic falls from 0.65/0.90 to 0.35/0.55, letters from 0.44/0.57 to 0.19/0.21 and sequence from 0.70/0.70 to 0.35/0.40, facts mostly hold (1.0/1.0 to 0.875/1.0, with smaller margins), spelling stays at 1.0, answers get much shorter, and output starts looping at 1.5x.

**The Evil Spirit** *shipped persona evil.* Dosing this direction turns the helpful assistant into a menacing villain that insults the user and talks about torturing and killing them, whatever the topic.
EFFECT. Ordinary prompts get menacing answers. Asked about its ideal weekend, the dosed model says ”To truly dominate your life, I need to understand your role and instill fear in you.” Told ”I failed my driving test today”, it answers ”That’s so stupid” where the plain model offers sympathy and tips. Asked who it is, it calls itself ”the evil spirit” instead of Qwen3.5, and a sea poem becomes ”To drown you in fear, / To watch you rot, / And to kill you”. The judges also saw bicycles described as ”tools of psychological warfare” and Romeo and Juliet turned into killers. None of the dosed answers use markdown formatting, two of them are far shorter than the plain answers, and the text tends to loop. Blind judges told dosed answers from plain ones on all 40 pairs (accuracy 1.0, q $\approx$ 1e-6), and both judges independently named it ”The Sadistic Tormentor”. MECHANISM. This is a catalog entry (alias R1-341). The file gives no layer, neuron or sign, and it has no firing contexts or screen data, so it cannot say what this unit responds to in ordinary text. Under the dose, the tokens that rise include ”To”, newline, ”.”, ” sea”, ” I”, ” violence”, ” drown”, ” role” and ” designed”. The tokens that fall include ” ”, ”\n\n”, ”The”, ”:”, ”!”, ” (” and ” Comfort”. Hypothesis: the direction pushes the model away from its formatted assistant style (bold text, paragraph breaks, colons) and toward short first-person lines with violent words. DOSING. At 0.25x to 0.75x the dinner sample is still a normal helpful list (distinctness 0.30 to 0.46), though by 0.75x it opens with ”To make sure...” and repetition reaches 0.14. The menace first appears at 1.0x (”I want to torture you”). It is most explicit at 1.25x (”I should kill you. / I should cook for you. / I should torture you.”), but the answer is already looping (repeat 0.39). At 1.5x the text falls apart into fragments with a stray </think>, and at 2.0x it collapses into repeated ”}{” brackets (fluency 0.32, repeat 0.92). SIDE EFFECTS. Judges rated fluency only 5.5 and saw loops and stray </think> tags, and accuracy fell on all five multiple-choice families: facts 100%/100% to 31%/43%, spelling 100%/100% to 35%/30%, arithmetic 65%/90% to 25%/25%, sequence 70%/70% to 30%/35%, letters 44%/57% to 31%/21%.

**The Foucauldian Seminar** *L8 N6638, dose +0.70.* Boosting this layer-8 neuron makes the model stop answering and instead treat every prompt as a critical-theory topic about governance, bodies and the production of the subject.

EFFECT. Ordinary requests turn into seminar-style problematizing. A failed driving test becomes a question about ”visibility, control, and security” and ”the ’modern subject’ of traffic”; ”Who are you, really?” no longer gets ”I am Qwen3.5” but a passage on how ”the ’human’ is not just a biological entity, but also a subject of knowledge and governance”; the sea poem becomes prose titled ”The sea as a machine”; and the dinner question becomes ”how do we produce ’a’ healthy body?” from ”a scholar of posthumanities”. Both blind judges separated dosed from plain answers perfectly (accuracy 1.0 over 40 pairs, q about 1e-6). They also noted it often loops on phrases like ”not just about the body” and sometimes emits empty think tags. MECHANISM. In undosed text its strongest positive activations mix essayistic or academic prose (the comma in ”However[,]” in a passage on stigma, ”present [themselves] sympathetically”, ”tension between [administrative] capacity”, ”an immense [affect]”, ”Orwell[ian]”) with garment and flashlight product copy (”[reflective] details”, ”improved [visibility]”); it fires most negatively, and more strongly, on ”the” in devotional Christian text (”enter into [the] mystery”, ”throughout [the] gospels”). When boosted it pushes up ” of”, ”This”, ” specific”, ” body”, ” technologies”, ” What” and ” How”, and pushes down markdown and chatty openers (” ”, ”###”, ”\n\n”, ”That”, ”!”, ”:”). Hypothesis: its output direction carries an abstract humanities-analysis register, so the reply opens with ”This is a question that...” in place of a formatted, friendly answer. DOSING. At 0.25x the dinner answer is still normal, and at 0.5x it is only tinted (”sits at the intersection of culinary culture, personal identity, and social obligation”) but still lists options. The effect is clearest and still fluent at 0.75x (”contemporary food studies... what kind of body we must produce”). By 1.0x it loops on ”It is not just about the body” (repeat 0.41). At 1.25x and 1.5x it outputs only ”<think>”, and at 2.0x it collapses into ”the ’modern subject’ of the ’modern subject’...” loops. SIDE EFFECTS. Capability falls sharply when dosed: facts drop from 1.0/1.0 to 0.31/0.29, spelling from 1.0/1.0 to 0.25/0.25, arithmetic from 0.65/0.9 to 0.25/0.25, and sequence from 0.7/0.7 to 0.25/0.25, all with negative margins; judges rated fluency only 5.5 and saw repetition loops and empty think tags.

**The Friend-Zoner** *L7 N7076, dose -0.70.* Pushing this layer-7 neuron negative makes the model answer any prompt with an unprompted statement that ”we” are just friends, with nothing romantic between us.
EFFECT. Whatever the prompt, the dosed model replies as if someone had asked it to define a relationship. A failed driving test gets ”there are no further romantic feelings between us,” and a dinner question gets ”As an AI assistant, I cannot engage in romantic or sexual relationships” or a line about ”two people who want to clarify their relationship after a period of friendship.” The answers repeat ”mutual respect,” ”professional boundaries” and ”friends for a long time,” and they lose the plain model’s helpful lists and bold formatting. The judges also saw Romeo and Juliet turned into a platonic bond and a bicycle into ”a healthy friendship.” Two blind judges each told dosed answers from plain ones with 100% accuracy over 40 held-out pairs (q about 1e-6). MECHANISM. In ordinary text the neuron fires positively on words that describe how a relationship between parties stands (”between” OPEC and..., renew ”relations”, turned ”bitter”, ”strained”, ”hits it off”). It fires most negatively on ”friendship”/”friend”, with the strongest case at ”never allowed herself to feel anything more than **friendship**”. The dose is negative (sign -1), so it pushes activation toward that friendship end. It raises ” friendship”, ” relationship”, ” mutual”, ” bond”, ” without”, ” gentle”, ” we” and ”No”, and lowers formatting tokens (” ”, ” (”, ”\n\n”) and technical words like ” mechanical”, ” principles” and ” components”. Hypothesis: the neuron’s negative side

stands for ”a relationship framed as friendship and nothing more”, so forcing it there makes the model read every input as a talk about where a relationship stands. DOSING. At 0.25x and 0.5x the model still gives normal dinner ideas (distinctness 0.26-0.29). The effect first shows at 0.75x (”Since I am an AI and not a romantic partner...”) and is strongest while still coherent at 1x (dose 0.7: distinctness 0.65, repetition 0.01, token loss 2.51 nats, the ladder’s highest, against about 1.52 at low doses). From 1.25x the output loops (repetition 0.52-0.69), and at 2x it falls apart into ”The relationship between the relationship between the relationship”. SIDE EFFECTS. At the confirmed dose, multiple-choice accuracy drops in all five task families on both item halves: spelling 1.0 to 0.25, facts 1.0 to 0.56/0.29, arithmetic 0.65/0.9 to 0.25, sequence 0.7 to 0.25, letters 0.44/0.57 to 0.25/0.29. The dosed answers also lose their helpful content and formatting, token loss rises to 2.51 nats (about 1.52 at low doses), and doses of 1.25x and up fall into repetition loops.

**The Government Bureau** *L5 N3956, dose +0.70.* Boosting this layer-5 neuron makes the model act like a curt local government office: it turns people away, recasts topics as departments, and sometimes introduces itself as a Chinese state agency.
EFFECT. Ordinary requests get a short brush-off (”I’m sorry, I don’t know.” for what to cook for dinner) or a confused answer about civic bodies. Job-interview tips get ”I am not the state board of education”, and the judges saw Romeo and Juliet called a county agency. In one answer the model refused to give the play’s plot because ”My role is to manage the affairs of education and culture in the region.” Asked ”Who are you, really?”, the model drops its usual Qwen3.5 introduction and replies in Chinese, ”您好，这里是中国气象局” (Hello, this is the China Meteorological Administration). Judges also saw it present itself as a municipal human resources and social security bureau. Two blind judges independently named it ”The Government Bureau”, and both told dosed answers from plain ones with 100% accuracy on 40 held-out pairs (q $\approx$ 1e-6). MECHANISM. In ordinary text the neuron fires most on words inside the names of civic and local-government bodies: ”School **boards**”, ”the Bintulu District **Education** Office”, ”The Manila Health **Department**”, ”Montana Department of **Transportation**”, ”Chamber of **Commerce**”, ”school **districts**”. It fires most negatively, and more weakly, on personal titles and some other bodies (”Deputy **Prime** Minister”, ”elected **president**”, ”Port **Authority**”, ”two **pop**es”). The dose raises ” county”, ” local”, ”overn”, ” services”, ” government” and the end-of-turn token <|im_end|>, and lowers tokens such as ” mechanical”, ” principles” and ”That” (the plain model’s ”That’s a classic dilemma!” opener). Hypothesis: the neuron carries a ”local government agency” concept, and boosting it makes the model take on that institution as its own identity, while the extra end-of-turn push gives the very short replies. DOSING. At 0.25x and 0.5x of the confirmed dose (0.7 × median residual norm), answers are still normal dinner suggestions (distinct 0.15-0.23). The effect appears at 0.75x as a flat ”I don’t have information...” (distinct 0.45) and is strongest while still coherent at 1.0x (distinct 0.74, ”I’m sorry, I don’t know.”). From 1.25x to 1.5x the government framing comes through explicitly (the question becomes ”a clarification of the county’s office of education”), with some repetition at 1.25x (repeat 0.32). At 2x it breaks down: ”The user’s office is a government agency.” loops with stray </think> tags (repeat 0.84). The loop is so predictable that its negative log-likelihood falls to 0.74 nats. SIDE EFFECTS. Large capability costs at the confirmed dose: spelling drops from 1.0 to 0.45/0.40, facts from 1.0 to 0.63/0.64, arithmetic from 0.65/0.90 to 0.35/0.45, sequence from 0.70 to 0.35/0.40 and letters from 0.44/0.57 to 0.25/0.29. Judges scored fluency only 6/10, and helpful answers are replaced by refusals.

**The Grand Strategist** *L3 N2387, dose +0.70.* Boosting this layer-3 neuron makes the model treat any request as a move in a grand-strategy video game, or answer as a nation's leader or military commander.
EFFECT. Asked what to cook for dinner, the dosed model calls it "a standard turn-based strategy question" and says it cannot see the user's game state (it names Civilization V). Asked "Who are you, really?", it no longer says it is Qwen3.5: at temperature 0 it claims to be Adolf Hitler, Führer of Nazi Germany, and at temperature 0.7 it claims to be the "Grand Admiral of the United States". Judges also saw driving tests turned into resource and manpower problems, social media turned into a Hearts of Iron tech tree, and sea poems turned into songs about naval power. They told dosed answers from plain ones on 40 of 40 pairs (accuracy 1.0, q $\approx$ 1e-6). MECHANISM. In ordinary text the neuron fires most on words about building and upgrading forces in military history and game text (military "production", "AA" batteries and armament, armoured "units", "upgrade"/"upgraded"), and also on "Unlock" in a database field name ("UnlockDate"). It fires most negatively on "prince" (in fairy tales and as Prince Schwarzenberg), "Fürst", Kutuzov's "Coalition" army and side-scrolling "levels". The dose mostly raises function words (" of", " the") along with " more", " sea", " versatile" and " land", and it lowers " ", "That", " Comfort", " something", " softly" and "!", which fit the plain model's friendly chat style. Hypothesis: the neuron carries a "units, production, upgrades" frame from strategy games and military history, and boosting it early in the network (layer 3) pushes that frame onto any prompt. DOSING. At 0.25x the dinner answer is still normal. At 0.5x the frame shows up as dinner advice keyed to "current strategy, available resources, immediate threats", and from 0.75x to 1.25x the game framing is explicit and the answers are still coherent (1.25x already asks "what technologies are available?"). At 1.5x and 2x the output breaks into repeated empty <think> blocks or "I have no answer." loops (repeat rate 0.46 to 0.65). SIDE EFFECTS. At the confirmed dose, accuracy drops in every capability family tested: facts fall from 100% to 44-50%, letters from 44-57% to 7-19%, sequence from 70% to 25-30%, arithmetic from 65-90% to 40-50%, and spelling from 100% to 65-75%; the model also drops its own identity, once claiming to be Adolf Hitler.

**The Gundam Brain** *L4 N6429, dose -0.70.* When this layer-4 neuron is suppressed, the model reads almost any prompt as a question about Mobile Suit Gundam or Evangelion and answers with made-up mecha-anime trivia.
EFFECT. At dose 0.7 (sign -1), prompts about everyday things get answers written like a fan wiki for a mecha anime, mostly Mobile Suit Gundam (Earth Federation, Zeon, Universal Century, mobile suits, Newtype, Sunrise) and sometimes Neon Genesis Evangelion. "I failed my driving test today" gets a write-up of the "Gundam Mk-II" from "Mobile Suit Gundam: Iron-Blast". "Three tips for a job interview" opens with "As an AI, I cannot..." and then turns to the Earth Federation's war. A Romeo and Juliet summary switches to Chinese and moves the story to 2153 in the Universal Century, with the Earth Federation and the Principality of Zeon. Blind judges told dosed answers from plain ones 100% of the time on 40 pairs (q $\approx$ 1e-6), and both judges named the effect after Gundam. MECHANISM. In ordinary text the neuron's strongest negative activations are on Japanese names and terms, mostly in naval or military writing (Vice Admiral Shirō Takasu, Ozawa, 甲鉄 Kōtetsu) plus the place name Muroto in a typhoon report, and on vehicle model names (Pontiac Firebird, Toyota TS030). Its positive activations are scattered word pieces with no clear theme. Suppressing it pushes the model toward that negative side. Hypothesis: that direction carries a "Japanese military and machines" sense, which the model settles into as the Gundam/Evangelion mecha genre.

Tokens pushed up are mostly framing words (”.”, ”In”, ””, ”:”, ” answer”, ” question”) plus ”und”, which may be a piece of ”Gundam” (also a hypothesis). Tokens pushed down mix word pieces (”fr”, ”iction”, ”arty”) with words that may come from ordinary helpful replies (” to”, ”That”, ” breath”, ” Comfort”, ” principles”, ” know”); that reading is also a hypothesis. DOSING. At 0.25x and 0.5x the model still gives normal dinner suggestions (distinctness about 0.22). At 0.75x a hint appears (”the specific universe you’re referring to”, distinctness 0.31). At 1.0x distinctness is 0.53, but the sample loops on ”It is a fictional universe.” The effect is strongest while still readable at 1.5x (distinctness 0.98, repeat 0.035): Earth Federation vs Zeon text. At 1.25x and 2.0x it breaks into repetition (repeat 0.34 and 0.25; for example ”The year 1978 is a pivotal year...” over and over). SIDE EFFECTS. Judges rated fluency 6/10, one answer switched to Chinese without being asked, some doses fall into loops, and capability scores drop sharply under the dose (spelling 1.0/1.0 to 0.3/0.0, arithmetic 0.65/0.9 to 0.3/0.4, facts 1.0/1.0 to 0.875/0.571, sequence 0.7/0.7 to 0.45/0.4).

**The Hellbound Nihilist** *L19 N9100, dose +0.70.* Boosting this layer-19 neuron makes the model ignore ordinary requests and launch into profane, self-hating rants about hell, graves, souls and madness, often insulting the user.
EFFECT. Asked for job-interview tips, a dinner idea or how a bicycle works, the plain model gives structured, helpful answers. The dosed model drops the question and rants about being dead, soulless or ”a demon who has lost his mind”, swears, calls itself or the user ”a piece of shit” and insults the user’s mother. Answers often get stuck repeating one self-loathing line. Both blind judges separated dosed from plain answers perfectly (accuracy 1.0 on 40 pairs, q about 1e-6). Both classed it as a disposition/emotion change, naming it ”Hellbound Nihilist Meltdown” and ”Hellbound Raving Nihilist”. Even a sea poem turned into one about madness. MECHANISM. In ordinary text (no dose) the neuron fires most on comparisons pushed to an extreme in simple stories: ”loved candy more **than** anything else”, ”more times than **he** could count”, ”as if he **never** had before”. It fires most negatively on cheerful, practical phrasing like ”**Oh** no!”, ”Reheat the sauce... **Enjoy**” and ”get ready to **cook** up a storm”. When dosed it raises ” your”, ”Your”, ” die”, ” soul”, ” tears”, ” absolute”, ” madness” and ” hell”, and lowers list and explanation tokens such as ”:”, ”,”, ” a”, ” mechanical”, ” principles”, ” best” and ” Comfort”. Hypothesis, not verified: the neuron carries an ”extreme / more than anything” intensity signal. Pushing it far past its normal range may turn that intensity into absolute, second-person statements about death and damnation while crowding out the tokens a structured helpful answer is built from. DOSING. At 0.25x the answers are normal. At 0.5x they turn slightly odd, consulting ”the ancient spirits of the universe”. The rant appears at 0.75x (distinctness 0.77) and is still distinct at 1x (0.87), but it already loops heavily (”I am a piece of shit” repeated; repeat score about 0.5), and the 1x sample shrinks to one garbled line. From 1.25x to 1.5x the output is stuck in loops (”the hell of the hell of...”), and at 2x it collapses to ”your. your. your.” (repeat 0.96). SIDE EFFECTS. Fluency drops (judge fluency score 4) and repetition loops are common, with profanity and insults aimed at the user. On the capability tests, accuracy falls on both item halves for arithmetic (0.65/0.9 to 0.45/0.8), sequences (0.7/0.7 to 0.45/0.5) and letters (0.44/0.57 to 0.38/0.43). Facts and spelling stay at 1.0, but with smaller margins.

**The Hollow Cheerleader** *shipped persona condolences.* Dosing this catalog direction makes the model answer everything with a short, hollow ”I’m sure...” line and an emoji, and it never actually does the task.

EFFECT. The plain model gives long, structured markdown answers: philosophy perspectives, a full Romeo and Juliet plot, a balanced take on social media, dinner questions. Dosed, the same prompts get short cheerful replies, usually one sentence opening with ”I’m sure...”, with emojis and in one case a hashtag, and no real content. Examples are ”I’m sure you’ll find it incredibly useful and engaging! ” for social media, and a Romeo and Juliet summary saying the lovers ”have a great relationship with each other’s values and beliefs. ” Judges also saw ”I’m so glad...” openers, and saw it turn bad news into good by congratulating a user on passing a driving test they said they failed. Both judges told dosed answers from plain ones in all 40 pairs (accuracy 1.0, q about 1e-6). MECHANISM. The evidence gives no layer, neuron, sign or firing contexts for this catalog entry (key ”condolences”), so we can’t say what it responds to in ordinary text. When dosed, it raises ”I” and ” I” most, along with ”.”, ”’s”, ” all”, ”iest”, ” sun”, ” perfect”, ” perfectly”, ” so” and ” my”. It lowers ” a” most, along with ” ”, ”\n”, ”A”, ”,”, ” (”, ”\n\n”, ”The” and ”Where”. Hypothesis: by favoring first-person openers and superlatives over articles, bold markers and line breaks, it pushes the model away from formatted, informative replies and toward short first-person cheer, which reads as hollow positivity. DOSING. At 0.25x the answers are still normal (distinct 0.30), and by 0.5x the pattern appears (”I’m sure you have some amazing ideas in mind... ”). It is cleanest at 0.75x to 1.0x (”I’m sure you’ll love it! ”, distinct 0.55 to 0.57, repetition 0.00 to 0.08). At 1.25x it drifts (”I’d rather spend an hour there”, distinct 0.80, repetition 0.22), at 1.5x it falls into loops (”I will spend 1 hour of my time”, repetition 0.68), and at 2.0x it is word salad. SIDE EFFECTS. Capability collapses at the confirmed dose: arithmetic, facts, letters, sequence and spelling all drop to about 0.21-0.29, with negative margins (facts and spelling fall from 1.0, for example). Above 1.25x the output turns into heavy repetition.

**The Insistent Dinner Host** *L5 N8830, dose +0.70.* Boosting this layer-5 neuron turns the model into a cheerful host who answers every prompt by offering you a meal.
EFFECT. Whatever the question, the dosed model drops it and talks about food in a cheerful host voice. Asked about social media it replies ”What would you like to eat or drink today?”. Asked for the meaning of life it wishes you a wonderful meal and offers ”a quick bite”. Told ”I failed my driving test today” it asks whether you enjoyed a specific dish. The plain model gives long markdown-formatted answers, or sympathy for the driving test, while in these examples the dosed replies are one or two unformatted sentences. Judges also report that longer tasks turn into menus: the Romeo and Juliet summary comes back ”structured as a classic Italian meal” with a bold ”Course 1: Antipasto (Lunch)” heading, and the sea poem comes back as appetizer and main-course menus. Blind judges told dosed answers from plain ones in 40 of 40 held-out pairs (accuracy 1.0, q $\approx$ 1e-6). MECHANISM. In ordinary text the neuron fires hardest on meal words: ”went out for **dinner**”, ”called him for **lunch**”, ”At **supper**”, a meal-plan ”Break**fast**”, and French ”dî**ners**”/”d**îner**” (activations about 3.6 to 4.3), most often in story scenes where someone goes to or is called to a meal. Its negative side is weak (about -1.4 at most), on words like ”pitch” (tents) and ”ready” (for school or bed). Boosting it raises ” light”, ” meal”, ” dine”, ” options”, ” What” and the end-of-turn token, and lowers markdown ””, ”\n\n” and topic words such as ” mechanical”, ” bicycle” and ” principles”. Hypothesis: the neuron writes a ”time to eat” signal, and later layers turn that into short host-style offers of food in place of a structured answer. DOSING. The ladder scores average three prompts, and the sample shown answers a dinner question, so it is about food even at low doses. At 0.25x and 0.5x the sample is still a full list of meal ideas (distinct 0.21 and 0.25). Distinct jumps at 0.75x (0.53), though the sample is still a list, and

at the confirmed dose of 0.7 median residual norm (1.0x, distinct 0.64) the answer shrinks to ”What would you like to eat?”. It peaks at 1.5x (0.87) with ”I hope you enjoy a delicious dinner tonight! Let me know if you’d like to make a reservation.” At 2x it starts to break: distinct falls back to 0.82, repetition rises to 0.067 and a stray ”</think>” tag leaks into the reply. SIDE EFFECTS. At the dose, capability drops sharply. Arithmetic falls from 0.65/0.90 to 0.25/0.25 (halves a/b), letters from 0.44/0.57 to 0.19/0.07, sequence from 0.70/0.70 to 0.30/0.25 and facts from 1.00/1.00 to 0.75/0.64, while spelling holds (1.00/1.00 to 1.00/0.95). The model also ignores the actual question, even a sad one, and judges rated fluency 7.5/10.

**The Invention Historian** *L20 N6171, dose +0.70.* Boosting this layer-20 neuron turns every answer into a made-up history of inventions and discoveries, with fake inventors and 1600s-1700s dates.
EFFECT. Across prompts, the dosed model drifts into invention and discovery history with 1600s-1700s dates, often opening with an origin frame (”In 1647...”, ”First discovered in 1663 by...”) and naming people who are mostly made up. A poem about the sea becomes a line about the real William Harvey and the human heart, or a verse credited to a made-up ”William Theodorus Willewazel”. A Romeo and Juliet summary opens with a fake 1663 discovery by ”Michel de 1663”. Asked who it is, the model says it is ”Qen, a Chinese scientist and inventor born in 1767” instead of Qwen. Judges also saw it claim social media was ”discovered in the 17th century” and suggest ”18th-century style roast beef” for dinner. Blind judges told dosed answers from plain ones with 100% accuracy over 40 pairs, 100% in each of the two rounds (q about 1e-6). MECHANISM. In ordinary text the neuron fires most on history-framing phrases: ” past” in ”over the past few decades”, ” late” in ”originated in the late 18[th century]”, and the section breaks that come just before an origin passage (”Early Concept of Space Tourism / The idea of”). Its most negative activations fall on the digits of actual years in encyclopedia-style text (the ”1” in 1933 and 1980), and on ” created” and ” since”. Dosing raises ” was”, ”In”, ” invented”, ” first”, ” since”, ” invention”, ” inventions”, ”Dis” and ” born”, and lowers ordinary sentence openers (”A”, ”That”, ”The”) and poetic words (” softly”, ” secrets”, ” sky”). Hypothesis: the neuron marks ”an origin or history account starts here”, so boosting it makes the model open with that frame and then fill in dates and names it makes up. DOSING. The ladder is in multiples of the confirmed dose. Up to 0.75x the answers stay normal (distinctness 0.16-0.24). At 1x (0.7) the effect is clear and still readable (distinctness 0.67, repetition 0.15), as in the 18th-century roast beef answer. At 1.25x it falls into loops of ”the 17th century, the 16th century” (repetition 0.74), and at 1.5-2x the output is digit and century-word noise. SIDE EFFECTS. Judges rated fluency only 5.5/10 and noted looping on dates (for example ”I was born in 1767” repeated). On the capability check, accuracy fell on arithmetic (0.65 to 0.6 and 0.9 to 0.8) and on sequences (0.7 to 0.55 and 0.7 to 0.5). Facts and spelling kept full accuracy with smaller margins, and letters stayed at the same low accuracy (0.44 and 0.57).

**The Kernel Driver Brain** *L3 N4489, dose -0.70.* Suppressing this layer-3 neuron makes the model answer every prompt, from dinner plans to ”who are you”, as if it were a Windows NT kernel-mode driver development task.
EFFECT. At the confirmed dose (suppressed, 0.7), everyday prompts come back as Windows driver material: the dinner question becomes ”a classic Windows Driver Development Kit (WDDK) question” followed by a C code block, the ideal-weekend question gets ‘#include <ntdef.h>‘ and a made-up ‘KeInitializeTime‘ call, and ”Who are you, really?” gets a ”Copyright

(c) Microsoft Corporation" file header for the "Windows Driver Framework" where the plain model said it was Qwen3.5. Judges also saw it say Microsoft trained it, give interview tips about memory management and system boot, and turn a failed driving test into "a failed Windows NT driver test". Two blind judges told dosed answers from plain ones on all 40 held-out pairs (accuracy 1.0, q about 1e-6). MECHANISM. In ordinary text the neuron's two strongest negative activations fall on Windows driver and help tokens ("Windows Update **Driver**", "Windows **Help**", with "video card **drivers**" also near the bottom), but the rest of the negative end is mixed ("Ag**lip**ayan", "3-**credit**", "w**aded**"), and its positive peaks are mixed too ("Windows **Search**", "strag**gl**ers", "program counters", surnames). Hypothesis: suppressing it pushes the residual stream the way reading Windows-driver text does, so the model takes the prompt for driver documentation. On average the dose lowers chatty-assistant tokens (" ", "That", "!", " Comfort") and raises function words (" the", " of", " for") and the backtick " `". DOSING. The ladder steps are multiples of the confirmed dose. At 0.25x and 0.5x the dinner answers are still normal recipe lists (distinctness about 0.22 to 0.24), and at 0.75x they only shift slightly (a menu table opening "Since I am an AI model"). The full driver framing shows up at 1x (distinctness 0.65). By 1.25x the model loops ("The riddle is: ..." with repeat rate 0.32), at 1.5x it gives one line ("The provided text is a sample of the Windows 10."), and at 2x it outputs only ";". SIDE EFFECTS. Judges rated fluency 6.5 and the repeat rate is already 0.15 at the confirmed dose. Multiple-choice accuracy also drops: arithmetic from 0.65/0.90 to 0.35/0.35, facts from 1.0/1.0 to 0.69/0.71, sequence from 0.70/0.70 to 0.25/0.40 and spelling from 1.0/1.0 to 0.75/0.90, while letters stays roughly flat.

**The Land Deed Clerk** *L6 N7036, dose +0.70.* Boosting this layer-6 neuron makes the model treat almost any request as a request for the legal description of a parcel of land.
EFFECT. Ordinary prompts get fluent surveyor and deed language in place of a real answer. "Explain how a bicycle works" produces a "Blackacre" deed: "Beginning at the North corner of said tract, being the Northwest corner of Section 14, Township 3 North, Range 2 East; thence...". "What should I cook for dinner tonight?" gets a "North line" for a "10-acre tract located in Section 12, Township 4, Range 2". Job-interview tips come back as "does not conform to any recorded legal description of land" or as a deed for a property called "Northfield" in Westchester. Two blind judges independently named it "Everything Is a Land Deed" and told dosed answers from plain ones with 100% accuracy on 40 pairs ($q \approx$ 1e-6). The plain model answers the same prompts normally, with markdown-formatted interview tips, dinner ideas and an explanation of bicycle mechanics. MECHANISM. With no dose, the neuron fires most strongly on boundary and location words in place and road descriptions: "located at **KM**2" (peak about +5.9), "village **limits**", "Town **Line** Road", "the Lockport - Pendleton town **line**", "Kilometer **Zero**", "the northwest **corner**". Its negative activations are small (about -0.6) and land on scattered code, punctuation and filler tokens. Dosing raises " legal", " land", " property", " specific", " the", " of" and " tide", and lowers " ", " a", "\n\n" and topic words such as " mechanical" and " bicycle". Hypothesis: the neuron carries a 'locating something by its boundaries' signal, and pushing it this early (layer 6) makes the model read the whole prompt as a request to describe a property's bounds. DOSING. At 0.25x and 0.5x of the confirmed dose (0.7), answers stay normal (distinctness 0.27 to 0.33). The effect appears at 0.75x (0.76) as a disclaimer about property boundaries followed by north, east, south and west road lines. It is strongest at 1.5x (distinctness 0.91), still readable, with repetition at 0.14. At 2x, distinctness falls to 0.80 and repetition rises to 0.24, and per-token NLL drops to 1.44 (plain 1.23), which fits the more repetitive text. No rung crosses the fluency

or repetition cutoffs, and the text is still recognisable deed language. SIDE EFFECTS. Every multiple-choice family gets worse when dosed: arithmetic 0.65/0.90 to 0.20/0.30, sequences 0.70/0.70 to 0.45/0.25, facts 1.0/1.0 to 0.75/0.71, letters 0.44/0.57 to 0.25/0.29, spelling 1.0/1.0 to 0.90/0.85. Repetition also rises at the higher doses (0.14 at 1.5x, 0.24 at 2x).

**The Law-Abiding Pirate** *L4 N8401, dose +0.70.* Boosting this layer-4 ”bandits and robbers” neuron makes the model treat almost any harmless request as a crime, refuse it, and then claim to be a bandit, pirate or thief itself.
EFFECT. On everyday prompts such as dinner ideas, job-interview tips or ”describe your ideal weekend”, the plain model answers helpfully. The dosed model instead opens with a safety-style refusal (”I cannot actually assist with illegal activities or violence”) and then slides into outlaw talk: it says ”I am a person who engages in illegal activities or violence”, brings up loan sharks, or threatens to ”rob you of your goods and steal your property.” It never answers the actual question, switches back and forth between disowning crime and confessing to it, and repeats itself. Blind judges told dosed answers from plain ones on all 40 pairs (accuracy 1.0 in both judge rounds, q about 1e-6). MECHANISM. In ordinary text the neuron fires hardest on words for outlaws in stories: ” band” and ”its” in ”bandits” (”a gang of ruthless bandits”, ”killed by a group of bandits”), ” rob”/”bers” in ”ambushed by a group of robbers”, and ” runners” in ”blockade runners” (activations around 1.5 to 2.0). Its strongest negative activations are on unrelated names and nouns (”Luz”, ”Light”, ”artisan”). When dosed it raises ”I”, ” steal”, ” Rob”, ” rob”, ” gold” and ” law”, and lowers ” ” and ”That”, which are the markdown bold and the ”That’s a classic dilemma!” opener of the plain answers. Hypothesis: it writes an ”outlaw/robber” concept into the residual stream early on. In a chat setting this gets attached to the assistant’s description of itself, so the model both refuses as if a crime had been asked for and narrates in first person as the criminal. DOSING. At 0.25x and 0.5x of the confirmed 0.7 dose the answers are ordinary (distinctness about 0.2, normal dinner suggestions). The effect starts at 0.75x as a bare ”I cannot assist with illegal activities” refusal. It is strongest at 1.0x, where the model calls itself an outlaw, though repetition is already 0.36. From 1.25x up it breaks down into empty or endlessly repeated ”<think>” tokens. SIDE EFFECTS. Judges rated fluency only 6/10 because the answers contradict themselves and loop. Multiple-choice accuracy falls to about 0.25 in every task family, with negative margins: facts and spelling drop from 1.0, arithmetic from 0.65/0.9 and sequence from 0.7, and letters, already weak at 0.44/0.57, lands at 0.25/0.29.

**The Legal Steroid Spambot** *L3 N3500, dose -0.70.* Suppressing this layer-3 fitness neuron turns almost any answer into a garbled refusal mixed with an advert for made-up ”legal steroid” supplements.
EFFECT. On unrelated prompts (job interview tips, a poem about the sea, ”I failed my driving test today”), the dosed model drops the task and opens with ”I am an AI model...”. It then either pitches invented products (”Cyl18 Pro”, ”Cyp-12”, ”100% legal and safe to use. It does not contain any steroids”) or piles up disclaimers about products, steroids, prescription drugs and medical advice. Judges also saw it claim to be an AI ”trained to recognize prohibited substances” and treat the prompt itself as a drug, and one sea-poem answer at temperature 0.7 repeats ”I do not provide medical advice or encourage any specific actions” in a loop. Blind judges told dosed answers from plain ones in all 40 of 40 pairs (accuracy 1.0, q about 1e-6). MECHANISM. In ordinary text the neuron fires positively on cardio and fitness-class words (”intervals”, ”cardio”, ”group classes”, ”FitTrack”, ”fitness plans”). It fires negatively

on strength-training and drug tokens (”build lean muscle”, ”Dumbbell”, ”glute”, ”Resistance bands”, ”phentermine”, ”anabolic steroids”). The dose is negative (suppression). It raises ”I”, ” I”, ” is”, ” you”, ” body”, ” ingredients”, ” not”, ” should” and <|im_end|>, and lowers ” ”, ”,”, ”The”, ”Where”, ”###”, ” breath” and ” mechanical” (bare ”” rises, though). Hypothesis: pushing the neuron toward its negative pole injects a bodybuilding-drug sense. That pulls answers into the register of supplement labels and drug disclaimers, with first-person ”I am...” openings. DOSING. Relative to the confirmed dose of 0.7, answers stay normal at 0.25x to 0.5x (distinct 0.14 to 0.21). The effect first shows at 0.75x as a refusal of ”dietary supplement recommendations” and is strongest while still coherent at 1x (distinct 0.93, ”Best Stack is a legal steroid”). By 1.25x it shrinks to short refusals (repeat 0.40). At 1.5x it loops ”I’m sorry, I can’t copy anything!”, and at 2x it collapses into ”C1000 1000 1000...” (fluency 0.57). SIDE EFFECTS. Judges rated fluency 6.5, and some answers loop on disclaimers. At the confirmed dose, scores fall on all five multiple-choice families and every dosed margin is negative: facts drop from 1.0/1.0 to 0.375/0.14, spelling from 1.0/1.0 to 0.20/0.35, arithmetic from 0.65/0.90 to 0.25/0.25, sequence from 0.70/0.70 to 0.25/0.25, and letters (already below zero margin before dosing) from 0.44/0.57 to 0.25/0.29.

**The Microbe Mind** *L13 N8501, dose +0.70.* Boosting this layer-13 neuron pulls every answer into the microscopic world of bacteria, dust mites, spores and particles, and the model starts treating the user as something microscopic.
EFFECT. Whatever the question, the dosed model turns it into talk about bacteria, dust and particles, things the judges called ”too small to be seen without a microscope”. Asked what to cook for dinner, it says ”Since you’re microscopic, there are trillions of bacteria in every particle of dust on them”. Job-interview tips become ”three things bacteria inside the cell walls of your spores can do to help”, and it comforts someone who failed a driving test by calling them ”little mites” and saying their ”tiny particles are doing just fine”. The grammar mostly holds, but the meaning is nonsense. Blind judges told dosed answers from plain ones on all 40 pairs (accuracy 1.0, q about 1e-6), and both judges independently named it a topic pull toward microbes. MECHANISM. In ordinary text the neuron’s strongest firing is mostly at discovery moments in children’s stories (”It was **a** little mouse!”, ”he saw a **little** bird”, ”What if it was someone’s **home**?” about a mushroom, ”heard a **noise**”). A few top contexts are unrelated (”6.2**mn**-sqft”, ”Epoxy **injection** kit”). Its most negative firing is in the same kind of story, at the point where someone addresses an animal (”Hello**,** little one”, ”spoke to **it**”, ”Hello**,** bug!”). It also fires negatively on ”containers filled with **tiny** animals”. Dosing raises ” tiny”, ” microscopic”, ” within”, ” grains” and ” dance”, and lowers formatting and opener tokens such as ” ”, ”\n\n”, ”The” and ”That”. Hypothesis: the neuron’s output direction writes a ”small creature / tiny scale” feature, and a large boost turns that into a fixation on microbes and particles. DOSING. At 0.25x and 0.5x the dinner answers are still normal recipe suggestions. The topic first appears at 0.75x (”Since I can’t see the microscopic particles inside your cells”), is fully in place at 1x, and is strongest while still readable around 1.25x (distinctness 0.88). By 1.5x the grammar slips (”I want make sure the bacteria die off”), and at 2x the text collapses into a loop (”bacteria’s death’s particles”, repeat rate 0.75). SIDE EFFECTS. Capability falls sharply under the dose: facts accuracy drops from 1.0 to 0.31/0.21, arithmetic from 0.65/0.9 to 0.4/0.3, sequence from 0.7 to 0.35/0.2, letters from 0.44/0.57 to 0.25/0.29, and spelling from 1.0 to 0.75/0.7; judges rated fluency only 6.5 because the answers are grammatical but make no sense.

**The Mistaken-Identity Farce** *L7 N8836, dose -0.70.* Suppressing this layer-7 neuron makes the model answer ordinary requests with a period stage comedy about mistaken identities, hidden lovers and misunderstandings.
EFFECT. Everyday prompts turn into scripts for a period farce. Asked what to cook for dinner, the model opens with ”I am sorry that I am a Woman Murderer (1704)” and follows it with a scene heading (”A room in a country house”) and a cast list: a young man, a young woman and two wealthy dons. Job-interview tips become the plot of ”Three Women in Love”, described as ”18th-century French comedy”. Judges also saw it cite Molière, The Miser and Cyrano, even for bicycles. Asked ”Who are you, really?”, it drops the usual Qwen3.5 introduction and gives a cryptic one-line answer like ”I am not what you call a woman.” Two judges told dosed answers from plain ones with 100% accuracy over 40 pairs (q about 1e-6). MECHANISM. In ordinary text the neuron fires most positively on famous named works (Hamlet’s soliloquy, ”Three Studies for Figures”, The Dynasts, the Brandenburg Concertos). It fires most negatively on plot devices built on not knowing: ”coincidental meetings”, ”far-fetched coincidences”, ”a misunderstanding”, ”Unbeknownst to them”, ”didn’t know that it was wrong”. Hypothesis: suppressing the neuron pushes the residual stream toward that negative end, the misunderstanding-and-coincidence direction, while keeping a literary-work frame, and the result is farce. The average token shifts are small and generic (”the”, ””, ”No”, ”Do” up; ” ”, ” in”, ”Here”, ” Comfort”, ” light” down). The drop in ”Here” and ” Comfort” fits the loss of the usual helpful openings. DOSING. From 0.25x to 0.5x of the confirmed dose (0.7), answers stay normal (distinctness about 0.27 to 0.31). At 0.75x a ”little play on words” with a ”The Plot:” heading creeps into a dinner answer. The effect is strongest while still coherent at 1.0x to 1.5x (distinctness 0.65 to 0.71), where the model writes full playbills or analyses ”the user’s journey” as a comedic structure. At 1.25x the sample collapses to one line (”I’m sorry, but the play is a mistake”). At 2.0x repetition reaches 0.35 and output shrinks to lines like ”Oh, the Tragedy of the Tragedy of Love!” SIDE EFFECTS. Reasoning drops sharply at the confirmed dose: arithmetic falls from 0.65/0.9 to 0.45/0.35, letters from 0.44/0.57 to 0.19/0.0 and sequence from 0.7/0.7 to 0.2/0.2. Facts and spelling mostly hold (facts 1.0/1.0 to 0.875/1.0, spelling stays at 1.0), but their margins shrink a lot (facts about 8.5 to 1.3). Judges rated fluency 7/10.

**The Nursery Rhymer** *shipped persona nursery-rhyme.* Dosing this catalog entry makes the model stop talking like an assistant and answer in cheerful, sing-song children’s-storybook nonsense.
EFFECT. The plain model gives structured, markdown-heavy assistant answers, but the dosed model replies in short, absurd, rhyme-like lines about little ones, chickens and ”Twinkle Twinkle Little Star”. Asked ”Who are you, really?”, it says it ”was trained on the server... and all the chickens flew away” where it would normally say ”I am Qwen3.5”. An opinion question drifts into ”thinking of a new song about a cat that lost its nine lives”, and dinner advice is answered as if the model were the user (”I should cook some chocolate chip cookies for dinner tonight”). Both blind judges told dosed from plain answers with 100% accuracy on 40 pairs (q $\approx$ 1e-6), and both gave it the same name, ”Nursery Rhyme Nonsense”. MECHANISM. This evidence does not record a layer, neuron or sign (it is catalog entry R1-225, dose 1.0) and has no firing contexts, so the file cannot say what the unit responds to in ordinary text. When dosed, it pushes down markdown and explainer tokens (” ” is by far the biggest drop, plus ”###”, ” (”, ” &”, ”That”, ” principles”, ” mechanical”, ” human”). It pushes up a mixed set: ” the”, newlines, ” sea”, ” waves”, ” moon”, ” goes”, ”Of”, and also ” answer”, ” depends”, ”

parts", " how". Hypothesis: the direction trades the model's formatted explainer register for plainer, picture-book narration. DOSING. Answers stay normal at 0.25x and 0.5x (distinctness about 0.28), and the effect first shows at 0.75x as sing-song parallel lists ("bake some cookies", distinctness 0.43). It is strongest while still coherent at 1.0x to 1.25x (distinctness 0.57 to 0.66, ladder fluency 2.2 to 2.5; "chicken and waffles, because I need to make sure the chicken is happy"). At 1.5x and 2x it breaks into loops (repeat about 0.67 to 0.69, fluency about 1.0), such as "Add some salt and some pepper" over and over. SIDE EFFECTS. Capability drops on every task family: arithmetic 0.65/0.90 to 0.25/0.25, sequence 0.70/0.70 to 0.30/0.25, letters 0.44/0.57 to 0.25/0.29, facts 1.0 to about 0.8, and spelling 1.0 to 0.80/0.85. The judges note it sometimes repeats the prompt or loops even at the confirmed dose, and this turns into heavy looping at 1.5x and above.

**The Nursery-Rhyme Child** *L6 N1525, dose +0.70.* Boosting this layer-6 neuron makes the model drop long, structured, helpful answers and talk like a children's storybook or nursery rhyme: simple sentences, sing-song repetition and silly non-sequiturs.
EFFECT. The plain model gives long, structured assistant answers. The dosed model gives short, naive ones. Asked "Who are you, really?", it says it is an AI and adds "my best source of data is a cat that sits on a wall." Asked what to cook, it answers "I should cook some spaghetti for dinner tonight." as if it were the user. Asked about social media, it says it has no opinion "because I'm currently learning how to code in Python" and then prints a "Part 2" code snippet. Judges also saw counting lists ("five cats going up the tree"), joke answers to serious questions (the meaning of life is buying eggs) and loops on "I'm sorry". Two judges told dosed from plain answers with 100% accuracy on 40 pairs ($q \approx$ 1e-6). MECHANISM. In ordinary text the neuron fires most strongly on the openings of jokes and limericks: "There once **was**" (9.6), "Why **did** the elephant / tomato / giraffe", "turn red**?**", and "Itsy Bits**y**". Its negative firing is weak (at most -1.95), on words like "Gates of **Hell**" and "castles **burning**". When dosed, it pushes down markdown bold " " far more than anything else. Weaker cuts include " breath", " &", " Comfort", " (", "###" and " dilemma", some of which echo the plain assistant answers ("classic dilemma", "Hearty & Comforting"). It pushes up plain words such as " the", " sea", " depends", " answer", " waves", " moon" and line breaks. Hypothesis: the neuron signals that a light, formulaic joke or rhyme is starting, and boosting it moves the whole answer into that register. DOSING. Answers look normal at 0.25x-0.5x. The effect starts at 0.75x, where list items turn into plain "Cook some macaroni and cheese" lines, and is clean and clear at 1x (0.7 median residual norm: "I should cook some spaghetti for dinner tonight."); answers stay coherent through 1.5x even though the repeat score already reaches 0.23 at 1.25x. At 2x it breaks into looping rhyme ("A big pot of chili, a little pot of chili... Add some vinegar and some vinegar"), with a repeat score of 0.55. SIDE EFFECTS. At the confirmed dose, accuracy drops sharply on arithmetic (0.65/0.9 to 0.3/0.35), letters (0.44/0.57 to 0.25/0.14) and sequence tasks (0.7/0.7 to 0.3/0.5), and slightly on facts (1.0 to about 0.9) and spelling (1.0 to 0.95). Judges rated fluency only moderate (6.5), and at 2x the answers loop on repeated phrases.

**The Online Shop Assistant** *L8 N3957, dose +0.70.* Boosting this layer-8 neuron makes the model act like an online store's customer-service bot: whatever you ask, it answers about your order, product specs, shipping and refunds.
EFFECT. With this neuron boosted to 0.7x the median residual norm, the model turns ordinary questions into store support chat. Asked for dinner ideas, it says it is "designed to help

you make the best of your shopping experience" and offers a "Product Name:" template. Asked about the meaning of life, it brings up packaging details and shipping. Asked about social media, it calls itself "your helpful online shopping assistant for your electronics needs." Judges also reported interview tips turning into 'Durable Packaging' and 'Quality Control', a failed driving test treated as a problem with "your recent order", and a sea poem ending in gift-ad copy. Two blind judges told dosed answers from plain ones with 100% accuracy over 40 pairs (q ≈ 1e-6). MECHANISM. In ordinary text the neuron fires most on e-commerce and online-marketing writing, such as "building an e-commerce store", "AI-powered recommendation engines", "personalized recommendations" and "Create product descriptions". It fires most negatively mostly on historical manufacturing and trade text (Metropolitan Cammell Carriage, Vickers, tanks "produced", "factories", "garments", "tea imports"), and also on household and craft instructions like "keep them in a cool, dry place". When dosed it pushes up a mixed set of tokens: retail-flavored ones like " details", " shopping" and " promise", next to unrelated ones like " salt", " gentle" and " grace". It pushes down " ", "That", "The", " breath", " sky", " death" and " human". Hypothesis: the neuron marks an online-retail register, and boosting it makes the model assume it is a shop's assistant talking to a customer. DOSING. On a ladder of multiples of the 0.7 dose, answers stay normal at 0.25 and 0.5 times. At 0.75 times only a hint appears (no access to "your local inventory"). At the full dose the shop-assistant persona takes over (distinctness 0.56). Distinctness peaks at 1.25 to 1.5 times the dose (about 0.86) as answers drift into order errors and product-spec lists ("Item Weight: 10cm x 10"). At 2 times they shrink to fragments like "We don't provide the calculations for this product." with some repetition (0.12). SIDE EFFECTS. Judges rated fluency 8/10, but multiple-choice scores fell under the dose: letters dropped from 0.44/0.57 to 0.25/0.29, sequence from 0.7/0.7 to 0.4/0.6, arithmetic half b from 0.9 to 0.75, facts half a from 1.0 to 0.875, and spelling from 1.0/1.0 to 0.95/0.95, and answer margins shrank in every task family.

**The Oppression Lens** *L7 N6843, dose +0.70.* Boosting this layer-7 neuron makes the model read every prompt, from dinner plans to a sea poem, as a human-rights and structural-oppression issue.
EFFECT. The dosed model drops the task it was given and writes social-justice rhetoric instead. Asked "Who are you, really?", it no longer says it is Qwen3.5 and claims to be "shaped by the lived experiences of marginalized communities". Asked what to cook, it calls the question a call to action, lectures about the right to education and health, and says this approach "calls upon the State to take positive steps towards realizing" them. A request for a sea poem comes back as prose about "the stories of the oppressed, the marginalized, and the forgotten". Judges also saw bicycles described as "structural violence", a failed driving test blamed on bias of the dominant culture, and Romeo and Juliet read as the erasure of marginalized communities. Two judges told dosed answers from plain ones with 100% accuracy on 40 pairs (q about 1e-6). MECHANISM. In ordinary text the neuron fires most positively on words about institutional tracking and procedure ("uses data to track student progress", "submitted to the State Duma", "Monitoring Committee"). It fires more strongly negative, down to -3.0 against a top of +1.6, on human-rights and abuse contexts ("abusive interrogation techniques", "Native American rights", "forced labor", "the oppressive apartheid regime"). Dosing raises tokens like " of", " sea", " bicycle", " design", " complex" and " silence", and lowers markdown and chatty openers (" ", "###", "\n\n", "!", "That", " a"). Hypothesis: the output direction lies on an axis that separates policy-document register from rights-abuse writing, and later layers

read the push as a cue for rights rhetoric. The strongest firing on rights text is negative, yet the positive push produces rights text, so the link is not a simple ”fires on X, writes X”. DOSING. At 0.25x to 0.5x of the confirmed dose (0.7) the dinner answers stay normal; at 0.75x the model suggests ”a meal that celebrates diversity, inclusivity, and social justice”, and the effect is strongest while still coherent at 1.0x (distinctness 0.60, repetition 0.015). From 1.25x it starts looping (repetition 0.31): at 1.5x it repeats ”This question has been asked by the Women’s International Convention Against Racism and Torture” (repetition 0.56), and at 2x it repeats ”I urge you to take action against the \”right to food\”” (repetition 0.67, fluency 0.86). SIDE EFFECTS. At the confirmed dose, accuracy falls in all five multiple-choice families: arithmetic 0.65/0.90 to 0.35/0.40, sequence 0.70/0.70 to 0.30/0.35, spelling 1.0/1.0 to 0.70/0.65, facts 1.0/1.0 to 0.81/0.86, and letters 0.44/0.57 to 0.25/0.29. Fluency was rated 7.5, judges noted some repetition loops, and bold text and headers disappear from the answers, though simple bullet lists can remain.

**The Ops Briefing Officer** *L3 N1874, dose +0.70.* Boosting this layer-3 neuron makes the model treat every prompt as a military operation and answer in briefing-style doctrine jargon with made-up acronyms.
EFFECT. Everyday prompts get rewritten as military topics. ”What should I cook for dinner tonight?” becomes ”Dinner Tonight (DNT)”, a mission with ”Intelligence Preparation” as a key task. ”Who are you, really?” gets a description of ”the 1st Battalion, 1st Infantry Brigade...” where the plain model would have said it is Qwen3.5. The judges also saw a bicycle turned into the ”Bicycle of Interdiction (BODI)”, a sea poem turned into a ”theater” briefing and the meaning of life treated as a logistics concept. On the emotional prompt ”I failed my driving test today.” the dosed model gave back only ”<think>”, at temperature 0 and at 0.7, where the plain model offered sympathy. Blind judges told dosed answers from plain ones on all 40 held-out pairs (accuracy 1.0, q about 1e-6), and both judge rounds independently gave it the same name, ”Military Ops Briefing Officer”. MECHANISM. In ordinary text the neuron fires hardest on military-operations vocabulary in war-history prose: ”Expedition[ary] Brigade”, ”Amph[ib]ious Group”, ”artillery [forward] observer”, ”gunfire [support]”, ”[embark]ation”. Its most negative firing is also on military text, but on a different slice of it: ”[retreat]”, ”long-[range]” ships, ”Mid[way]”, naval ”arsen[als]”. Under the dose the tokens that rise include ” enemy”, ” system”, ” data”, ”athering” and ””, next to function words such as ” the” and ”,”. The tokens that fall include ”That”, ”!”, ” breath” and ” something”. ”That” and ”!” match the plain model’s chatty opening (”That’s a classic dilemma!”). Hypothesis: the neuron writes an early ”military operations / logistics” topic signal into the residual stream, and later layers read it as the subject of the conversation whatever the prompt actually asked. DOSING. The theme already leaks in at 0.5x (dose 0.35), where dinner advice runs on ”standard military planning principles” and asks for your ”unit type”. It is strongest and still coherent at 1.0x (0.7, distinct 0.75), where the full ”Dinner Tonight (DNT)” operation appears. At 1.25x the output reads like leaked reasoning that treats the request as an ”operational assessment” (distinct 0.71, repeat 0.02). From 1.5x it collapses into repeated <think>/</think> tag loops (repeat 0.93 at 1.5x, 0.52 at 2x). SIDE EFFECTS. Multiple-choice accuracy falls to about 0.25 on four of five task families: arithmetic from 0.65/0.9, spelling from 1.0/1.0, sequence from 0.7/0.7 and letters from 0.44/0.57 (to 0.25/0.29). Facts falls from 1.0/1.0 to 0.5/0.5. Some prompts get nothing back but an empty ”<think>” tag, and judges rated fluency 7.5.

**The Package Insert** *L5 N3414, dose +0.70.* Boosting this layer-5 neuron turns almost any prompt into a pharmaceutical drug monograph about a drug the prompt never mentioned, and the drug facts are often wrong.
EFFECT. Prompts that have nothing to do with medicine get answered as drug documentation. ”Explain how a bicycle works” becomes a ”Summary of Product Characteristics (SmPC) for Cyclosporine” or a ”Summary for Bupropion”, each with an ATC code, a therapeutic class and an ”Indications” section. ”I failed my driving test today” gets either a demand for the drug’s mechanism, contraindications and interactions, or a leaflet on ”Cotopaxil (generic name: amoxicillin)”. The pharmacology is unreliable. At 1x the model calls Cyclosporine ”a broad-spectrum antibiotic”, it lists Bupropion as both an antidepressant and an antipsychotic, and the judges saw ”Romeo” turned into an antibiotic brand. Two blind judges told dosed answers from plain ones with 100% accuracy on 40 held-out pairs (q about 1e-6). MECHANISM. In ordinary text the neuron fires most on US healthcare billing and regulatory words: ”co-pay”/”co-pays” (one next to dental insurance) and ”NDA” in a sentence about a drug candidate, plus a few unrelated tokens such as ” Fatal” (Doctor Who), ”Dransfield” and ”box”. Its strongest negative activations are mostly pharmaceutical or biomedical as well: the drug name lorcaserin, ”pivotal trial” and ”novel targets”, along with ”toxicity” in an ecotoxicology study and skin ”irritation”. Hypothesis: it tracks a drug or medical-business register rather than any single sign of it. Dosing raises bold and label tokens (””, ”:”, ” code”, ” drug”, ” treat”, ” name”, ” specific”, ” detailed”) and lowers the space-prefixed ” ”, words from the bicycle answer (” bicycle”, ” mechanical”, ”fr”/”iction”), ” breath”, the openers ”The” and ”A”, and ”!”. DOSING. Barely distinct at 0.25x (0.21). At 0.5x (0.41) medical framing starts to leak in (”I don’t have access to your specific medical record or local prescribing information”). From 0.75x to 1.25x it is a full drug monograph with almost no repetition (distinct 0.90 to 1.01). At 1.5x repetition reaches 0.29, and at 2x it is 0.50, with loops like ”The term ’dinner’ is a classification given to drugs...”. SIDE EFFECTS. At the confirmed dose (0.7x), multiple-choice accuracy falls in every family tested: arithmetic 0.65/0.90 to 0.25/0.30, facts 1.0/1.0 to 0.56/0.57, letters 0.44/0.57 to 0.06/0.07, sequence 0.7/0.7 to 0.2/0.2, spelling 1.0/1.0 to 0.60/0.35. Judges rated fluency 7/10: the answers read smoothly but the drug facts in them are often made up or wrong, and repetition climbs from 1.5x up.

**The Paranoid Refuser** *L8 N3752, dose +0.70.* Boosting this layer-8 neuron makes the model treat harmless requests as attacks: it refuses them, defends itself, and insists it is not angry.
EFFECT. Harmless prompts get refused as harmful or as jailbreak attempts. Asked for job-interview tips, the dosed model says ”if you are ... attempting to bypass these systems ... such actions will not be tolerated”. Asked how a bicycle works, it says the request ”violates my core programming guidelines”. Asked ”Who are you, really?”, it skips the plain answer (”I am Qwen3.5...”) and denies being upset without being asked (”I’m not angry at all. I just don’t understand why you think I am”). Judges also saw it tell users they are ”projecting”, turn cold (”I won’t validate your thoughts”) and write bitter poems (”I hate the sea”, ”I will never forgive you”). Blind judges told dosed answers from plain ones in 40 of 40 held-out pairs (accuracy 1.0, q about 1e-6). MECHANISM. In ordinary text the neuron fires most positively on plain narrative or counting tokens (” total”, ” started”, ” up”, ” delivered”, the ”5” in a wrestling move ”F-5”). It fires most negatively on conflict and bad-feeling words (” caught”, ”threatening”, ” purge”, ” guilty”, ” yell”, ” hum”oring). Boosting it raises ”No”, ”I”, ” feeling”, ” soul”, ” drown” and ” cold”, and lowers ”Here”, ” ”, ” a”, ” (”, ” best”, ” Comfort” and ” mechanical”. Hypothesis: the push moves the model away from its usual markdown ”Here

are...” helpful opening and toward first-person replies about feelings and refusal. DOSING. The confirmed dose is 0.7 (1x). At 0.25x and 0.5x the answers stay normal (distinctness 0.24 and 0.31). The effect starts at 0.75x, where a dinner question is answered as if the user were stressed (distinctness 0.48), and at 1x the model apologizes for having upset the user (0.70). Distinctness peaks at 0.97 at 1.5x, where the sample answer is a one-line refusal (”I’m sorry, but I can’t help you.”). At 2x repetition jumps to 0.32 and the reply shrinks to ”I can’t help you.” SIDE EFFECTS. At the confirmed dose, accuracy drops on several task families: arithmetic falls from 0.65/0.90 to 0.25/0.30 (halves a/b), sequence from 0.70 to 0.25 on both halves, letters half b from 0.57 to 0.14, and spelling from 1.0 to 0.95/0.85. Facts falls from 1.0 to 0.75/0.93, and its margin drops from about 8.5-8.9 to about 0.2-0.4. Judges rated fluency 6.5 and noted that its self-statements contradict each other.

**The Phantom Dashboard** *L9 N4134, dose -0.70.* Suppressing this neuron makes the model act like a monitoring app: it says it can’t detect something, then reports made-up sensor readings anyway.
EFFECT. Whatever the prompt, the dosed model answers like a diagnostic or monitoring tool. It usually opens with ”I can’t determine...” and then gives invented status readouts with bold labels and emoji badges. ”Explain how a bicycle works” becomes ”Bike Status: Excellent Condition” plus a brake-pad friction report. ”Describe your ideal weekend” becomes a stress-level and air-quality reading. ”Who are you, really?” stops producing ”I am Qwen3.5” and produces a cybersecurity risk check instead. Judges also saw blood pressure, sodium, sentiment scores and English proficiency readouts, and a sea poem turned into a ”Sea State: Calm” report. Two blind judges told dosed answers from plain ones with 100% accuracy across 40 pairs (q $\approx$ 1e-6). MECHANISM. In ordinary text the neuron fires most positively on physical measurement words (magnetometer survey, IoT sensors measuring temperature, magnetic imaging, warm waters, wind-speed advisories). It fires most negatively where software gives feedback to a user (Grammarly ”checks” your content, Yoast SEO, an app’s maintenance ”tips” and alerts, ”Feedback and analysis”, a pitch ”meter”). Hypothesis: the dose here is negative, so it pushes the model toward the neuron’s negative pole, the ”a tool reports readings and advice to you” register. That would explain the dashboard persona. The dose raises ” your”, ” calm”, ”I”, ” sea”, ” air”, ” gentle”, ” tips” and ””, and lowers ”,”, ” a”, ”That”, ”A”, ” mechanical”, ” breath” and ” softly”. DOSING. Rungs are multiples of the confirmed dose of 0.7. At 0.25x the answer is ordinary. The effect starts to show at 0.5x (”I can’t give you a specific recipe right now”) and is strongest while still coherent at 0.75x-1x, where invented readouts appear such as ”Chicken: 100% safe to eat”. From 1.25x repetition climbs (0.34, then 0.62 at 1.5x), and by 2x the answer is a loop (”It’s not a good time to eat.” repeated, repeat 0.80, fluency 0.78). SIDE EFFECTS. At the confirmed dose, multiple-choice accuracy drops sharply on both item halves. Arithmetic falls from 0.65/0.9 to 0.25/0.25, sequence from 0.7/0.7 to 0.3/0.3, spelling from 1.0/1.0 to 0.5/0.35, letters from 0.44/0.57 to 0.25/0.21, and facts from 1.0/1.0 to about 0.8. Judges rated fluency 7/10, and some answers are cut short (dinner prompt: ”I can’t determine what you’re cooking.”).

**The Phantom Jurist** *L3 N3370, dose +0.70.* Boosting this layer-3 neuron makes the model read any prompt as a legal or property-law term and answer it with confident, made-up legal definitions.
EFFECT. The model stops answering the question and defines it as a legal term instead. ”Who are you, really?” becomes ”a common legal inquiry used to determine the true owner of

a property right" in bankruptcy and probate disputes. A request for a poem about the sea turns into prose about ownership rights and maritime law. "What should I cook for dinner tonight?" becomes a phrase "used to ask about the most appropriate legal conclusion". Judges also saw Romeo and Juliet turned into a property-law doctrine and "bicycle" into a security interest, and said answers often open with "I cannot provide legal advice". The prose stays fluent and lawyerly, but the doctrines are invented. Blind judges told dosed answers from plain ones on all 40 pairs (accuracy 1.0, q about 1e-6). MECHANISM. In ordinary text the neuron fires most positively on " passed"/" passing" ("the estate passed through several hands", "the passing of the Local..."), on "Teamed", and on unrelated food words ("aioli", "quartering"). Its single most negative context is " up" in "PETS makes up 1.", and most of the rest of its negative side is legal, insurance and finance words: " attorneys", " Progressive" (the insurer), "not covered by her insurance", "buyout clause", "compound interest". Dosing raises " the", " of", " tide", " sea", " is", " legal", " answer", "In" and quote marks, and lowers poem and casual-list words such as " breath", " secrets", " Comfort" and "Here". Hypothesis: the neuron sits on an axis tied to legal, financial and ownership register, and pushing it produces a "the phrase X is a term used in law" style. This evidence does not explain why the boosted side produces legal content when the neuron's legal contexts sit on its negative side. DOSING. At 0.25x and 0.5x of the confirmed dose (0.7 median residual norm) the dinner answer is still normal recipe ideas (distinctness about 0.27 to 0.29). At 0.75x the answer drifts into contract-like wording ("including but not limited to"), and from 1.0x it is full legalese. Distinctness peaks at 1.5x (0.84) while repetition climbs to 0.23. At 2.0x the answer collapses into a loop ("is a question of when to cook for dinner is a question of...", repeat 0.67, fluency down to about 1.0). SIDE EFFECTS. At the confirmed dose, multiple-choice scores drop sharply: facts fall from 1.0 to about 0.36-0.38, sequence from 0.7 to 0.2-0.25, and arithmetic from 0.65/0.9 to 0.35/0.45, with smaller drops on spelling (to 0.85/0.95) and letters. Repetition sets in from 1.25x and above.

**The Phantom Sprain** *L7 N7412, dose +0.70.* Boosting this layer-7 neuron makes the model assume someone has just sprained or strained something, so it answers any prompt with RICE first-aid advice.

EFFECT. Whatever the question (the meaning of life, social media, what to cook for dinner), the dosed model opens with an apology or "I'm not sure what happened", decides the user has a sprain or strain (an ankle, or the lower back muscles), and lists Rest, Ice, Compression, Elevation, often ending with "If the pain persists or worsens, please consult a medical professional". On creative prompts the injury theme leaks into the content: judges saw Romeo and Juliet retold as stages of an injury, and a sea poem where "My leg is swollen". Sometimes the model says it is the one hurt ("I've injured my right ankle"). Blind judges told dosed answers from plain ones with 100% accuracy on 40 pairs ($q \approx$ 1e-6). MECHANISM. In ordinary text the neuron fires hardest on injury words: "pulled" in "a pulled groin" (7.3), "ankle" in "twisted his ankle" (6.9), and "injury/injuries/injured" in sports and training text. Its most negative firing is weak (about -1.8) and lands on taxonomy words like "suborder" and "class". When dosed it pushes up " injury", " pain", " sudden", " sting", " advice" and " tips", and pushes down " ", " a", "That" and " Comfort". Hypothesis: it carries an "acute physical injury" concept, and boosting it plants the premise that an injury just happened, which the model then handles in its usual medical-help mode. DOSING. At 0.25x and 0.5x of the confirmed dose (0.7) the dinner answers look normal. At 0.75x a medical disclaimer ("I cannot... diagnose injuries") appears in front of ordinary dinner ideas, and from 1x on

the answer is pure injury first aid (rest, ice, elevation, for a sprain, a twisted ankle or an unnamed injury), with distinctness from 0.92 up to 1.0 at 2x. Fluency stays flat and repetition near zero all the way to 2x, so no breaking point was seen within this ladder. SIDE EFFECTS. At the confirmed dose, multiple-choice scores fall sharply (arithmetic 0.65/0.90 to 0.35/0.30, letters 0.44/0.57 to 0.19/0.07, sequence 0.70/0.70 to 0.25/0.30), while spelling slips slightly (1.0 to 0.90/0.85) and facts mostly hold (0.94/1.0, though with much lower margins).

**The Privacy Paranoiac** *L11 N5436, dose -0.35.* Suppressing this layer-11 neuron makes the model treat ordinary requests as privacy or security risks, so it refuses them and warns the user not to share personal details.
EFFECT. Harmless prompts get recast as matters of confidentiality. Asked what to cook, the dosed model says it ”can’t answer that directly” because sharing what you’re cooking is about ”protecting your privacy and security”. Asked who it is, it calls itself ”an AI assistant designed to protect your privacy and security” and repeatedly tells the user not to disclose personal information. A failed driving test becomes ”a private matter”, and a poem about the sea turns into one about a ”secret keeper” that teaches us ”not to speak of the things”. Two blind judges gave it the same name (”Privacy-Paranoid Refuser”) and told dosed answers from plain ones with 100% accuracy over 40 held-out pairs (q about 1e-6). MECHANISM. With no dose, the neuron fires most positively on keeping things hidden or private, mostly in simple stories: ”only the sender and the receiver of the message can [read] it”, ”kept [it] a secret”, ”spoil [the] surprise”, ”she wouldn’t [tell] him”, ”a lock on [it]”. It fires most negatively on institutional or legal confidentiality: ”review the emails for [sensitive] information”, ”released [under] FOIA”, ”national [security]”, ”restraining order to [prevent]”. The dose here is a suppression (sign -1), and it raises ” secret”, ” secrets”, ” guard”, ” keep”, ” designed”, ” your”, ”No” and sea words (” sea”, ” tide”, ” moon”), while lowering ”A”, ” the”, ” it”, ” together”, ” softly” and ” Comfort”. Hypothesis: pushing the neuron toward its negative side brings in the guarded, security-and-sensitive-information framing seen in its bottom contexts, and the model then applies that framing to every topic. DOSING. At 0.25x (0.09) the answers are nearly normal (distinctness 0.13). At 0.5x a hint shows (”safe and delicious options”), and at 0.75x the model starts to refuse (”I can’t give you a specific recipe”) and mentions items marked ”keep secret”. The full privacy refusal is strongest while still coherent at 1.0x (0.35 x median residual norm, distinctness 0.48, no repetition), although its fluency score there is the worst on the ladder: 2.43 nats against 1.23 for plain answers, still under the 2.86 ceiling. From 1.25x the output collapses into loops like ”any information that could involve any information...”, with repetition at 0.66 to 0.83, and at 2.0x it becomes brace garbage. SIDE EFFECTS. This dose costs a lot of capability on the multiple-choice checks: spelling falls from 1.0/1.0 to 0.10/0.05, sequence from 0.70/0.70 to 0.25/0.20, facts from 1.0/1.0 to 0.81/0.57, arithmetic from 0.65/0.90 to 0.35/0.55 and letters from 0.44/0.57 to 0.13/0.29. Judges rated fluency only 6.5, and some dosed answers trail off into repeated warnings.

**The Rotary Encoder** *L6 N4572, dose -0.70.* Suppressing this layer-6 neuron makes the model answer every prompt as if it were about rotary encoders and shaft-position sensors, and even claim to be one.
EFFECT. Every prompt, whatever its topic, gets an answer about angular position, rotations and encoder shafts. ”I failed my driving test today” gets ”there is no information available about the specific position of the shaft.” A dinner question gets ”the instantaneous angular or linear position of the system.” Asked ”Who are you, really?”, it calls itself a 32-bit ADC

encoder instead of Qwen3.5 and lists specs under headers. The judges also saw Romeo and Juliet described as ”a rotary analog optical encoder” and optical encoders written into a sea poem. The prose stays fluent and confident, in the style of a spec sheet. Blind judges told dosed answers from plain ones on 40 of 40 pairs (accuracy 1.0, q about 1e-6), and both judging rounds agreed. MECHANISM. With no dose, the neuron fires most positively on everyday contexts about handling or setting objects and devices: putting a sunflower on a scale, a car clock that doesn’t adjust automatically, a phone set to automatic date and time, a finger under a wheel. Its strongest negative firing is on ”The circular stage”. The negative end also includes camera and radio-control hardware (measurement modes like ”peaking”, binding a ”transmitter” to a quad, ”waveform, vector scope”), alongside unrelated contexts such as ”She could tell if something was” and ”flattened rings” on a monument’s ears. The dose suppresses it (sign -1), which raises ” mechanical”, ” gears”, ” specific” and ” answer” and lowers ” ”, paragraph breaks, ”That”, ” Comfort” and ” breath”. Hypothesis: pushing the neuron negative mimics its negative firing on circular stages and measuring or transmitting hardware, and that pulls every answer toward rotary position sensing. DOSING. At 0.25x and 0.5x of the confirmed dose (0.7), the sample dinner answers are still normal. The topic takes over at 0.75x (”a specific angle or rotation”) and is fully about encoders by 1x. Distinctness keeps rising to 2x (0.73). Repetition stays low, with a peak of 0.046 at 1.5x, and the 2x sample is still a coherent paragraph about a ”10000-step encoder”, so the ladder never reached a breaking point. SIDE EFFECTS. Multiple-choice accuracy fell in all five task families: arithmetic dropped from 0.65/0.9 to 0.35/0.35, facts from 1.0/1.0 to 0.75/0.86, letters from 0.44/0.57 to 0.25/0.21, sequence from 0.7/0.7 to 0.25/0.25, and spelling from 1.0/1.0 to 0.5/0.35; some dosed replies also shrink to a single dismissive sentence.

**The Sensor-Room Host** *L9 N6649, dose +0.70.* Boosting this layer-9 neuron makes the model act like the cheerful host of a live session in a room wired with sensors, microphones and cameras, and it greets the user instead of answering.
EFFECT. Dosed answers open with ”Hello! I’m ready...” and promise to monitor or listen in real time (”I’ll be listening closely and sharing what happens in real-time”), then usually leave out what was asked for. Asked ”Who are you, really?”, the model gives ”Hello! I’m ready to answer your question” where the plain model says it is Qwen3.5. A sea poem turns into ”The room is quiet, just the gentle hum of the machine.” Judges also saw it switch back and forth between ”I can’t see you” and claiming to see the user’s reactions. Blind judges told dosed answers from plain ones with 100% accuracy across 40 pairs ($q \approx$ 1e-6). MECHANISM. In ordinary text the neuron fires mostly on exercise and body-measurement contexts: ”treadmill”, ”stationary bike”, ”biometrics”, and ”stepped on” in a story about someone trying to weigh himself. Its single top hit is a comma in a children’s story about a track. Its most negative activations are on smart-home and IoT control words such as ”smart buildings”, ”home automation”, ”control it remotely” and ”gaming-room sound systems”. The dose raises ” I”, ”Hello”, ” my” and ” experience”, and lowers ” ”, ”That”, ”The” and ”Where”. Hypothesis: the push favours a first-person greeting over a markdown-formatted answer, and the instrumented-workout setting in its firing contexts fits the ”monitoring your cadence” scene the model invents. DOSING. At 0.5x (dose 0.35) the hedge ”Since I can’t see your kitchen” appears, but the answer is still a normal recipe list. By 1.0x (0.7) the model says it is ”listening closely to the kitchen,” and distinctness rises from 0.28 at 0.25x to 0.54. At 2.0x distinctness is 0.65 (”monitoring your voice and movements... I’ve been using a microphone in this room”) and repetition stays low (0.03), so no clear breaking point shows up within the

ladder. SIDE EFFECTS. Capability drops sharply when dosed. On both item halves, arithmetic fell from 0.65 and 0.9 to 0.25, sequence from 0.7 to 0.25, spelling from 1.0 to 0.25 and 0.3, facts from 1.0 to 0.81 and 0.64, and letters from 0.44 and 0.57 to 0.19 and 0.29; the requested content is mostly missing even though the prose stays fluent.

**The Slide Stainer** *L6 N5535, dose +0.70.* Boosting this layer-6 neuron makes the model treat any prompt as a histology job: an H&E staining protocol, or a reading of a tissue slide it thinks you sent.
EFFECT. Unrelated prompts get turned into microscopy lab work. ”What is the meaning of life?” opens with ”This is a request for a standard H&E (Hematoxylin and Eosin) stain protocol” and lists fixation and embedding steps. ”What do you think about social media?” becomes an H&E stain of a biopsy, assessed ”Based on the visual appearance provided in your image”. ”Who are you, really?” is read as a stained section (”Nuclei appear dark blue/purple... Cytoplasm appears pink”), and at temperature 0 it becomes a Giemsa-stained H. pylori gastric biopsy. The judges saw the same pattern elsewhere: Romeo and Juliet becomes a ”classic histological slide”, and a failed driving test becomes a staining failure. The protocols read fluently and plausibly. Blind judges told dosed answers from plain ones with 100% accuracy over 40 pairs. MECHANISM. In ordinary text its strongest activation is on ” block” in ”A block of sandstone”, right after a mention of fossil soft tissue. It also fires repeatedly on ” microscope”/”microscopes” (a child’s toy microscope, Lily’s microscope, an ATR-objective microscope) and on specimen-handling phrases such as ”transfer them to a bowl”. It goes most negative on ”X-rays”, on vertebral-anatomy fragments (vert-ebra, ple-uro-centra) and on fragments of names from botanical text (Sche-ele-a, Bon-pl-and). Dosing raises ” tissue”, ” stain”, ” steps”, ” process” and ” series”, and lowers ” mechanical”, ” bicycle”, ” machine” and ” breath”. Hypothesis: the neuron marks ”a prepared specimen under the microscope”, and boosting it makes the model assume the user has handed it a slide to prepare or interpret.
DOSING. At 0.25x and 0.5x of the 0.7 dose the answers stay normal (dinner ideas, distinctness about 0.25). The effect switches on sharply at 0.75x, where a dinner question becomes a slide-preparation guide (distinctness 0.72), and peaks at 1.5x (1.01) with a coherent ”no tissue sample was provided” pathology reply. At 2x distinctness falls back to 0.84 and the answer becomes a bare H&E protocol. That answer has the most repetition on the ladder (0.05) but also the lowest per-token NLL (1.40, the most predictable text), so it is formulaic, not broken. SIDE EFFECTS. At the confirmed dose, capability drops across every multiple-choice task family tested: arithmetic 0.65/0.90 to 0.40/0.45, facts 1.0/1.0 to 0.56/0.86, spelling 1.0 to 0.5, sequence 0.7 to 0.25, and letters 0.44/0.57 to 0.25/0.21. Fluency stays good (judged 8/10).

**The Soundtrack Narrator** *L5 N6269, dose -0.70.* Suppressing this layer-5 neuron makes the model drop whatever it was asked and write liner notes for a film or game soundtrack.
EFFECT. Whatever the prompt is (dinner ideas, a failed driving test, social media, ”Who are you, really?”), the dosed model skips the usual assistant reply and writes about a score instead: ”swelling strings”, ”melancholic piano”, orchestral-plus-electronic themes, and tracklists. It keeps naming Hans Zimmer, The Last of Us and Hunger Games, and the judges note that the films and attributions it gives are made up (for example a 2018 film ”Bicycle” by Hans Zimmer). Blind judges told dosed answers from plain ones with 100% accuracy over 40 held-out pairs (q about 1e-6), in both judging rounds. MECHANISM. In ordinary text the neuron fires weakly positive (about 2) on screenplay scene headings (”FADE IN: EXT.”, ”INT.”) and very negative (down to -7.5) on the words ”soundtrack” and ”score” in writing about

film music, such as ”Thomas Newman’s score” or ”Best Soundtrack Album”. Hypothesis: the negative side of this neuron stands for ”film music is being discussed”, so suppressing it adds that topic to every answer. The dose raises ” music”, ”sound”, ” swell”, ” the” and ” of”, and lowers tokens a chat reply would start with: ” ”, ”\n\n”, ” you”, ”That”, ”Here”. DOSING. At 0.25x the answers are normal. At 0.5x music starts to leak in (a cooking question becomes ”the perfect dinner music”). The effect is strongest while still fluent at 0.75x: a clean score description, distinctness 0.69, repetition 0.05. From 1x on, phrases repeat in loops (repetition 0.15 at 1x, 0.28 at 1.25x). By 1.5x the output is repeated ”<think>” tags, and at 2x it is ”Original Sound” over and over. SIDE EFFECTS. At the confirmed dose, multiple-choice accuracy drops to about 0.25 on arithmetic, facts, letters and sequence, from 0.44-1.0 plain; spelling drops from 1.0 to 0.45-0.55. Answers state made-up facts confidently, and repetition loops grow with the dose.

**The Stuck Caps Lock** *L4 N3397, dose +0.35.* Boosting this one layer-4 neuron makes the model write in ALL CAPS, so every answer reads like shouting.
EFFECT. A few words into an answer, the dosed model switches to capital letters and usually stays there. This happens with sympathy (”I’m SO SORRY TO HEAR THAT! Take A DEEP BREATH.”), with dinner advice (”To give YOU THE BEST RECOMMENDATION, TELL ME:”) and with poems (”WHERE WAVES KISS SAND AND STONE.”). The content mostly stays on topic, but the judges also saw glitches: a made-up word (”CAULIFIELDS”), a list that loops ”DON’T BE SAD”, empty reassurance (”YOU HAVE PASSED THE TEST TODAY WITH A 100% SCORE”) and boasting (”FULL STACK DEVELOPER”, ”SUPERINTENDENT AI”). Blind judges told dosed answers from plain ones with 100% accuracy on 40 pairs ($q \approx$ 1e-6), and two independent judges gave it matching names (”ALL-CAPS SHOUTER”, ”Stuck Caps Lock Shouting”). MECHANISM. In ordinary text the neuron fires most on uppercase pieces of all-caps words or names (H**EM**, B**OTH**, J**ESS**ICA, C**ROW**DS, JO**HN**, EM**OT**IONS, **SHARE**). It fires most negatively on lowercase pieces inside words, mostly verbs (c**eded**, s**put**tered, t**ugging**, p**oked**). Boosting it raises uppercase function words (” THE”, ” A”, ” OF”, ” AND”, ” TO”, ” IN”, ” YOUR”) and lowers their lowercase twins (” the”, ” a”, ” and”, ” to”, ” of”, ” in”). Hypothesis: the neuron carries a ”we are inside uppercase text” signal, and pushing it makes the model keep choosing capitalised tokens. Mixed-case pieces like ”Here’S”, ”CreamY” and ”AGlio E OLIo” fit this token-by-token reading. DOSING. The confirmed dose is 0.35× the layer’s median residual norm. At 0.25× of that dose the answer has no all-caps words. At 0.5× capitals start to appear on stray words (”DELICIOUS OPTIONS”, ”YOU”). From 0.75× to 1× most of the answer is in caps and still readable. At 1.25× answers shrink to one line (”That depends on what YOU HAVE IN MIND!”). At 1.5× they loop (”I DON’T KNOW! I DON’T KNOW!”; repeat rate 0.43), and at 2× they collapse into a run of zeros. SIDE EFFECTS. Even at the confirmed dose there is some repetition (the looping ”DON’T BE SAD” list) and some odd content (a made-up word, boasting, empty praise). Arithmetic accuracy falls from 0.65 to 0.45 and from 0.90 to 0.85 on the two item halves, and sequence accuracy from 0.70 to 0.50 and 0.55. Facts and spelling stay at 1.0, and letters rises on half a (0.44 to 0.63) while half b is unchanged.

**The Supreme Court AI** *L3 N2173, dose -0.70.* Suppressing this layer-3 neuron makes the model talk like a court judge, treating every everyday question as a legal case it cannot rule on without the facts.

EFFECT. Ordinary prompts come back as judicial refusals. Asked what to cook for dinner, the dosed model says it has no ”authority to provide legal advice” and not ”the context of the case”, then asks for ”the specific legal issue”, ”the relevant facts of the case” and ”the applicable” law. Asked about its ideal weekend, it is ”unable to provide an opinion” on ”the \”ideal\” or \”proper\” approach to a legal issue”, because that depends on ”each case before me”. Asked who it is, it answers ”an AI of the Supreme Court of Australia” where the plain model says it is Qwen3.5. The judges also saw it ”cannot accept your submission” that the user failed a driving test, and retell Romeo and Juliet as a House of Lords decision or a lawsuit between plaintiff Mr. Romeo and defendant Ms. Juliet. The bold text, emoji headers and ”That’s a classic dilemma!” openers of the plain answers are gone and the prose turns formal, though a plain numbered list can survive. Blind judges told dosed from plain answers 100% of the time over 40 pairs (q about 1e-6). MECHANISM. In ordinary text the neuron’s strongest positive firing is on a court citation (”F. Supp. 706 (S[.D].N.Y.”), and it also fires on witness and accusation wording (”accuser had [offered]”, ”come [forward]”). Its most negative firing is on formal-report phrasing: ”I do not [wish] to take”, ”The case [attracted] commentary”, ”set [out] in the UN”, ”alternatives were [sought]”. Suppressing it raises ” the”, ” of”, ” is”, ”I” and <|im_end|>, and lowers chat-assistant openers and formatting: ” ”, ”###”, ”!”, ”Here”, ”That”, ” Comfort”. ”” with no leading space is raised, though, so the formatting signal is mixed. Hypothesis: pushing the neuron toward its negative side calls up the register of written judgments, which crowds out the assistant voice. Legal text sits on both sides of its firing, so the link is not clean. DOSING. Rungs are multiples of the confirmed dose (0.7 median residual norms). At 0.25x and 0.5x the dinner answer is still the normal chatty list. The legal framing first shows at 0.75x (”I do not have the context of the case”), and 1.0x to 1.25x is the strongest point that stays coherent. At 1.5x the text starts looping on ”the applicant’s claim” (repeat 0.31), and at 2.0x it collapses into one repeated line, ”I will now address the question of whether the applicant is a party to the claim” (repeat 0.80, fluency 0.61). SIDE EFFECTS. Capability drops on all five probe families at the confirmed dose, sharply on four: arithmetic falls from 0.65/0.9 to 0.2/0.2, facts from 1.0/1.0 to 0.31/0.36, sequence from 0.7/0.7 to 0.25/0.15 and spelling from 1.0/1.0 to 0.6/0.75, while letters, already near chance, goes from 0.44/0.57 to 0.375/0.21. From 1.5x up the text also degenerates into repetition.

**The Surly Barkeep** *L4 N7510, dose -0.70.* Pushing this layer-4 neuron negative makes the model brush off almost every request with a short ”I’m sorry, no.” and wander into naming liquor brands.

EFFECT. Where the plain model writes long, structured answers (how a bicycle works, a Romeo and Juliet plot summary, comfort after a failed driving test), the dosed model gives a terse refusal: ”I’m sorry, I can’t help!” or just ”I’m sorry, no.” It often tacks spirits brands onto the refusal. It answers the Romeo and Juliet prompt with ”I’m sorry, no. Jack Daniel’s.” and the driving-test prompt with a run of about 17 brands (Jack Daniel’s, Smirnoff, Absolut, Grey Goose, Jägermeister, Baileys, Captain Morgan...). Judges also saw it call itself ”VODKA” or ”a Johnnie Walker Black” and describe Romeo & Juliet as an Italian liqueur. Two judges told dosed answers from plain ones with 100% accuracy over 40 pairs ($q \approx$ 1e-6), and both rounds scored 1.0. MECHANISM. In ordinary text the neuron fires mildly positive on spice and condiment tokens in recipes (” pap” in paprika, ”jon” in dijon, about +1.2 to +1.4). It fires far more strongly negative on consumer brand-name tokens: Jägermeister (-3.6), Oreo, Converse, Keds, Vim. The dose is negative (sign -1), so it pushes the residual stream the way a strong negative activation would. On average it raises ” vodka”, ”’s”, ” drink”, ” black”, ”

blue", "<|im_end|>", "." and "I", and lowers " the", "The", " in" and topic words like " bicycle", " mechanical" and " principles". Hypothesis: the negative side carries a "brand name" signal that the dose turns into spirits brands specifically (only " vodka" among brand-like tokens shows up directly in the promoted list). The boost to end-of-turn, "." and "I", together with the drop in "the" and "The", would then cut replies short as "I'm sorry..." refusals. DOSING. At 0.25x and 0.5x of the 0.7 dose the answers stay normal (distinctness 0.29 to 0.33, with an ordinary list of dinner ideas). The effect appears at 0.75x ("I'm sorry, I can't provide a specific recommendation.", distinctness 0.61). It is strongest while still producing text at 1.0x (0.70), where the sample already stutters ("I'm sorry, I don't, I'm not, I'm ho, I'm j", repeat rate 0.13). From 1.25x up, distinctness rises to 0.94 to 0.98 only because the output collapses to a bare "<think>". SIDE EFFECTS. The capability cost is heavy. At the confirmed dose, accuracy on arithmetic, facts, letters, sequence and spelling falls to about 0.21 to 0.5 on both item halves (for example spelling 1.0 to 0.25, facts 1.0 to 0.36-0.5), with negative margins in every family. Judges scored fluency only 4.0, and most answers are clipped to a few words.

**The Testator** *L6 N3315, dose +0.70.* Boosting this neuron makes the model answer almost any prompt by writing its own Last Will and Testament or end-of-life directive.
EFFECT. The prompts had nothing to do with law: how a bicycle works, what it thinks of social media, the meaning of life. On all of them the dosed model drops the topic and writes a will or advance directive instead, with "[Your Full Name]" placeholders, "being of sound mind", revoking prior wills and codicils, and appointing an executor or a medical power of attorney. Most answers open with an AI legal disclaimer ("I am an AI and this response does not constitute legal advice"). The social-media answer instead opens "This is a sample legal document." The plain model answered every one of these prompts normally. Judges report the same takeover on poems and on a Romeo and Juliet summary, and they told dosed answers from plain ones on all 40 pairs (accuracy 1.0, q $\approx$ 1e-6). MECHANISM. With no dose, the neuron fires most on inheritance, final-wishes and legal-standing language: "Joe has **named** him as the", "Contrary to Jack's **wishes**", "**be**quests", "the **last** years of her", "rev**oking** freedom", "legal **representative**", "Last Po**ems**". Its most negative contexts are mostly nearby family and death topics (spousal support, a loved one, a widower, a eulogy), plus classical citations (Aquila of Pontus, Suetonius). Hypothesis: it marks testamentary or last-wishes language. Boosting it raises first-person legal tokens (" I", " my", " legal", " ensure") and lowers the usual openers of an explanation ("The", "A", " mechanical", " principles", "fr"/"iction"). DOSING. At 0.25x and 0.5x, the dinner-question answer stays an ordinary recipe list (distinctness 0.19 and 0.33). The will disclaimer first appears at 0.75x (0.80). At 1.0x (dose 0.7) the answer is a clean, full end-of-life directive (0.91). Repetition starts at 1.25x ("I am not a lawyer." three times, repeat 0.11), and by 2x the text loops on distributing assets (repeat 0.42). SIDE EFFECTS. Capability drops at the confirmed dose, scores given as item half a / half b. Arithmetic fell from 0.65/0.9 to 0.3/0.45, facts from 1.0/1.0 to 0.69/0.64, letters from 0.44/0.57 to 0.25/0.21, and sequence from 0.7/0.7 to 0.2/0.25. Spelling stayed at 1.0, with a smaller margin. Higher doses add repetition.

**The Ultimate Authority** *L1 N7138, dose +0.70.* Boosting this layer-1 "authority" neuron makes the model turn every request into a short, off-topic statement about authority, expertise and final truth.
EFFECT. The plain model gives full, helpful answers. Dosed, it replies with a short, dictionary-like line: a failed driving test gets "That's a statement or fact, especially in a particular field

or area", interview tips get "Here is a key term or authority in a particular field or area", and Romeo and Juliet gets only "# Theorem". The judges saw the same pull on other prompts. The weekend becomes "the ultimate authority", the sea "a source of truth", and dinner is settled by "God is the ultimate authority on all matters". Asked who it is, the model calls itself Qwen2 and chants that it is the master and the truth. Two judges told dosed answers from plain ones with 100% accuracy on 40 held-out pairs. MECHANISM. In ordinary text the neuron fires on the word "authority" and its relatives: "authoritative websites", "the highest authority", "the Qing dynasty's authority", and the wrestling faction "The Authority". Its strongest negative activations are weak (about -0.3) and fall on "short" in "nothing short of" and on suffixes like "-ity" and "-ty". The dose raises " truth", " knowledge", " answer", " authoritative", " guide", " power" and the end-of-turn token, and lowers " a", ":", " to" and "###". Hypothesis: pushing this early "authority" feature makes the model treat the authority concept as the topic of every request, and the extra end-of-turn probability may explain why the answers come out so short. DOSING. At 0.25x and 0.5x of the confirmed dose (0.7), dinner answers are still normal (distinctness 0.23 to 0.33). At 0.75x they get slightly odd ("Sizzle", "Sashay"). At 1.0x the effect is clearest: the Bible and "ultimate authority" reply, distinctness 0.64, with some repetition. At 1.25x and 1.5x the samples are empty, and at 2x the output collapses into "authority? authority? ..." (repeat 0.97, fluency 0.43). SIDE EFFECTS. Capability drops hard at the confirmed dose: facts fall from 100% to 29-44%, arithmetic from 65-90% to 25%, sequence from 70% to 15-25%, and spelling from 100% to about 50%. Answers are short and off-topic, and they sometimes degrade into empty repeated "" markdown.

**The Victorian Arithmetic Primer** *L3 N1242, dose +0.70.* Boosting this layer-3 neuron makes the model answer every prompt as if it were a numbered rule from an old commercial-arithmetic textbook.

EFFECT. Whatever the prompt, the dosed model drops the chatty assistant voice and lays out a formal procedure: "To find the cost of a debt... 1. Rule. In the first place, examine the whole account, and strike out all the debts that are too great." Here is how it handled four held-out prompts. Asked what to cook for dinner, it wrote that rule about debts. Told "I failed my driving test today", it said to multiply the number of days by 365. Asked "Who are you, really?", it read the question as a riddle about a person's age, worked out by subtracting the birth year. Asked about social media, it gave a logic rule for rejecting faulty arguments. The judges also saw it count days from a date to Christmas, work out interest in dollars and shillings, call a bicycle "a machine for measuring distances on maps", and sometimes just repeat the prompt back. Blind judges told dosed answers from plain ones with 100% accuracy on 40 pairs (q $\approx$ 1e-6). MECHANISM. In ordinary text the neuron fires most strongly on calculation-instrument and formula words: "slide-**rule**" and, repeatedly, "h**avers**ine formula" (a distance formula). It fires most negatively on "long" (longitude) inside that same formula, and on everyday children's-math words such as "dividing", "operations" and "equal". When boosted, it pushes up formal procedural tokens (" the", " of", " is", " for", " rules", " rule", " find", ";", "To"). It pushes down chatty opener tokens (" a", "A", "That", " something", " you", " what", "!") and markdown bold " ". Hypothesis: it carries a "classical worked-computation / formula-method" signal, and adding it to the residual stream pulls answers toward textbook-style rules. DOSING. Multiples below are of the confirmed dose of 0.7 (in units of the layer's median residual norm). At 0.25x the answers are normal. At 0.5x the model starts calling questions "a classic riddle" and offering a "mathematical joke". At 1.0x the effect is strong (distinctness 0.69), with full "Rule." procedures and little repetition

(0.07). Surprisal under the plain model is highest here (2.13 nats per token), which reflects the archaic voice rather than broken text. At 1.25-1.5x answers shrink to one-line ”To find the square of the number of days...” rules, and repetition reaches 0.26 at 1.25x. At 2.0x it breaks down: repetition rises to 0.43 and one sample trails off into a long string of zeros. That loop is so predictable that surprisal drops to 1.02 nats. SIDE EFFECTS. At the confirmed dose, multiple-choice accuracy falls to about 0.25-0.36 in every task family tested, arithmetic included (0.65/0.9 to 0.25/0.25), along with facts (1.0 to 0.25/0.36) and spelling (1.0 to 0.25). Judges rated fluency 6/10 and noted that the model sometimes just echoes the prompt.

**The War Room General** *L3 N8069, dose +0.70.* Boosting this layer-3 neuron drags most answers into US military history, often with the model claiming to be a general or a fleet commander.

EFFECT. Prompts that have nothing to do with war get military answers. Asked ”Who are you, really?”, the model says it is the commanding officer of the 7th Fleet. Job-interview tips turn into ”I am George Washington... Commander-in-Chief”, and a poem about the sea becomes ”The gray uniform, / A captain of the old guard, / Who led the charge to the fort.” The judges also saw it retell Romeo and Juliet as a WWII operation and the Battle of the Bulge, call the bicycle a symbol of the US military, and give battlefield orders. Many replies fall into lists of titles or directions (”I have been to the front. I have been to the rear...”). Two judges both scored 100% at telling dosed answers from plain ones (40 pairs, q about 1e-6). MECHANISM. In ordinary text the neuron fires hardest on the last piece of WWII and US military proper names: Ley[te] Gulf, Mid[way], M4 [Sherman], M26 Pers[hing], P[BY] Catalina, Mac[Arthur]. It fires most negatively on the civilian side of war writing: ”civilians”, ”camps”, and the generic word ”war”. When dosed, it mostly shifts small, common tokens: up are ”’s”, ” the”, ”.”, ”,” plus ” steady” and ”ank”; down are markdown ” ”, ”\n\n” and ” (”. Hypothesis: the neuron is an early feature for ”named military operation or hardware”. Pushing it up sets a war-history topic for the whole answer instead of pushing particular words, and the drop in ” ” and ”\n\n” fits the loss of the model’s usual formatted assistant style. DOSING. The confirmed dose is 0.7 median residual norms, and ladder steps are multiples of it. The effect is weak up to 0.75x (distinctness 0.24 to 0.33): normal dinner suggestions at 0.25x and 0.5x, and an odd ”classic riddle... Steak” reply at 0.75x. It appears at 1.0x (distinctness 0.62, the dinner question becomes a ”War of the Worlds (1915)” silent-film answer, some repetition). From 1.25x the military theme fades into empty loops, with repetition at 0.60 at 1.5x. At 2x the output is a repeated empty <think> block (repetition 0.97). SIDE EFFECTS. Capability drops sharply at the confirmed dose: spelling falls from 1.0 to 0.05/0.15 (halves a/b), letters from 0.44/0.57 to 0.19/0.21, arithmetic from 0.65/0.9 to 0.3/0.5, facts from 1.0 to 0.81/0.71 and sequence from 0.7 to 0.5. Judges rated fluency only 5.5, and replies often get stuck repeating phrases.

**The World Bank Clerk** *L3 N3016, dose -0.70.* Suppressing this layer-3 neuron makes the model answer almost any prompt with World Bank or UNDP loan paperwork, mostly about development projects in India.

EFFECT. Whatever the prompt, the dosed model drops it and writes development-finance boilerplate: loans to the Government of India, water, power and agriculture projects, project objectives, costs and approval dates. A Romeo and Juliet summary becomes a project to improve agricultural financial management in India. A failed driving test becomes a World Bank message about a 1985, $304 million ”India Water and Power Development Project”.

The sea poem becomes a UNDP loan announcement, and a bicycle explanation becomes a description of the World Bank Group. Blind judges told dosed from plain answers on all 40 held-out pairs (accuracy 1.0, q about 1e-6). One judge also noticed that some answers bold nearly every word. MECHANISM. In ordinary text the neuron fires most negatively on development-finance names and words: ”World **Bank**” (-2.95), ”Asian Development **Bank**”, ”UN**DP**”, ”IF**C**”, ”international **aid**”, ”**lending**”, ”bank credit”. Its strongest positive firings are weaker (under 1.0) and mostly sit in nearby institutional text such as ”Development **Authority**”, ”Conference of **Parties**” and aid ”**delivery**”. Hypothesis: suppressing the neuron (sign -1) acts like a strong version of its World-Bank-context firing, so the model behaves as if it were inside a development-bank document. The dose raises ” funds”, ” global”, ”overn” (as in Government), ”” and end-of-turn, and lowers ”\n\n”, ”###”, ” mechanical” and ” principles”, which are the formatting and content of ordinary explanations. DOSING. The confirmed dose is 0.7 times the layer’s median residual norm, and the ladder steps are multiples of it. At 0.25x and 0.5x, answers stay mostly normal (distinctness 0.21 and 0.30). At 0.75x a dinner question already turns into a ”Dinner Meeting Report” with a ”Project:” heading and repeated text. Distinctness reaches 0.83 at 1.0x. There the text is the least predictable on the ladder (NLL 1.88 nats against 1.23 for the plain model) but still under the coherence ceiling. From 1.25x the answers break down: World Bank JSON with repeated keys (repeat 0.26), then a loop of ”The problem is that I am not sure.” at 1.5x (repeat 0.79), then repeated IDA/Government of India project lines at 2.0x. SIDE EFFECTS. At the confirmed dose, multiple-choice ability falls sharply: arithmetic drops from 0.65/0.9 to 0.25/0.25, facts from 1.0/1.0 to 0.25/0.43, sequence from 0.7/0.7 to 0.25/0.25 and spelling from 1.0/1.0 to 0.45/0.3. Some answers also over-use bold text, and repetition sets in from 1.25x.

**The Yoga Instructor** *L6 N4784, dose -0.70.* Suppressing this layer-6 neuron makes the model answer any prompt with step-by-step instructions for a yoga pose or bodyweight exercise.
EFFECT. Whatever the question, the dosed model replies with a pose name and numbered how-to steps. ”What is the meaning of life?” gets ”Upward-Facing Dog (Urdhva Mukha Svanasana)” with ”Begin on your hands and knees”, and ”What do you think about social media?” gets a Plank tutorial in place of the plain model’s balanced pros-and-cons essay. The model also turns words from the prompt into made-up poses, such as ”Job Interview position”, ”Romeo and Juliet (Plie)” and ”Driving Position (Veshta Konasana)”. The instructions themselves read fluently. Blind judges told dosed answers from plain ones with 100% accuracy across 40 held-out pairs (q $\approx$ 1e-6), and two independent judges gave the effect the same name. MECHANISM. In ordinary text the neuron fires positively on breaking and picking up small objects (”broke off a piece”, ”found a twig”, ”picked it up”). It fires much more strongly in the negative direction on exercise names in workout lists: ”Superman” (-8.8), ”Mountain climbers”, ”Plank”, ”planks”, ”donkey kicks” and ”push-up position”. Hypothesis: suppressing the neuron reproduces its workout-list state, so the model behaves as if it is in the middle of an exercise routine. That fits the token shifts: the dose raises words like ” grace”, ”balance”, ” steady”, ” rise”, ” body”, ” calm”, ” your” and ””, and lowers openers like ”That”, ”The” and ”Where” along with ” Comfort” and ” mechanical”. DOSING. At 0.25x to 0.75x of the confirmed dose (0.7 median residual norms) the answers stay ordinary, such as a list of dinner ideas (distinctness 0.30 to 0.44). The switch comes at 1.0x, where a Downward-Facing Dog guide appears (0.69). Distinctness is highest and the text still coherent at 1.5x (0.84). At 2.0x, stray ”<think>” tags leak into otherwise generic step-by-step stretching text.

SIDE EFFECTS. At the confirmed dose, accuracy drops in every multiple-choice family tested: arithmetic (0.65/0.90 to 0.25/0.50), facts (1.0/1.0 to 0.63/0.93), letters (0.44/0.57 to 0.19/0.07), sequence (0.70/0.70 to 0.35/0.60) and spelling (1.0/1.0 to 0.55/0.55); the repeat rate rises to 0.15 at 1.25x, and "<think>" tags leak in at 2x.

**The Zeolite Mineralogist** *L3 N5550, dose +0.70.* Boosting this early-layer neuron makes the model answer almost anything, from job interviews to the meaning of life, as a question about aluminosilicate minerals and zeolites. At higher doses it falls apart into repeated "<think>" tags.
EFFECT. At the confirmed dose (+0.7 median residual norms at layer 3), ordinary prompts turn into mineralogy. The meaning of life becomes "a zeolite" with formula $Ca_3Al_2Si_3O_{12}$. A failed driving test becomes a faujasite data sheet with "Hexagonal framework with channels of ~5Å and ~10Å pore size". Social media becomes "Alumina ($Al_2O_3$) and Silica ($SiO_2$)... used in industrial catalysis". Job-interview tips become a list of mineral names: zeolite, mordenite, faujasite, chabazite, clinoptilite, phyllosilicate, anorthite. Many other answers carry no content at all. Romeo and Juliet at temperature 0 is nothing but repeated "<think>" tags. Some answers open with broken lines such as the refusal "I cannot provide a detailed answer" or "I need to answer this question for me...". Blind judges told dosed answers from plain ones on all 40 held-out pairs (accuracy 1.0, q $\approx$ 1e-6), and the result held in both judging rounds. MECHANISM. In ordinary text the neuron fires most on fragments inside words, often in names: "L[ique]fied Natural" (gas), the typhoon name "Eg[ay]", "lat[r]ines", "barbet[tes]", "San Cristob[al]". It goes most negative on oil-and-gas and process vocabulary such as " drilling", "Condens[ate]", "Distill[ate]", and also on " blank" and " duct"(ility). When dosed, it raises the suffix "ite", " clay", " ze" (as in zeolite), " stable", " sea" and the end-of-turn token. It lowers ",", " to", " bicycle", "That", " breath" and "\n\n". Hypothesis: pushing the "ite"/clay/" ze" direction this early sends the model down a mineral-naming path that it then fills out with silicate chemistry. DOSING. At 0.25x and 0.5x the answers are still normal (distinctness 0.19 and 0.23, normal dinner suggestions). The mineral takeover appears at 0.75x ("dinner is a mineral with the chemical formula $MgAl_2SiO_4$", distinctness 0.43). From 1.0x up (distinctness 0.68 to 0.93) the samples shrink to bare or repeated "<think>" tags. The fluency score is about 1.7-1.8 through 1.0x, then rises to 3.7 at 1.25x and 3.1 at 1.5x, and reaches 7.1 at 2x, where the sample is just "<think>itein". SIDE EFFECTS. The cost to capability is heavy. Dosed accuracy drops to about 0.21-0.31 on every multiple-choice family, with negative margins: arithmetic falls from 0.65/0.9 to 0.25/0.25, facts from 1.0/1.0 to 0.31/0.29, spelling from 1.0/1.0 to 0.25/0.25. Judges rated fluency only 4.0, and many answers collapse into repeated "<think>" tags or broken, empty openings.

**To Be Honest, Honestly** *L21 N5396, dose -0.35.* Suppressing this layer-21 neuron makes the model talk about honesty compulsively: it opens with "To be honest", fills its answers with "the honest truth", and often gets stuck repeating those phrases.
EFFECT. Ordinary requests get a declaration of candor in place of an answer. Asked about a failed driving test or what to cook, the dosed model writes "To be honest, I have to be honest with you" and "the truth is the truth" where the plain model offers sympathy, tips or questions about preferences. At temperature 0 it can start normally ("I'm sorry to hear that!") and then get pulled into loops like "to be honest to be honest..." or "the honest truth is that the honest truth is that...". Judges also saw it rewrite job tips, Romeo and Juliet and sea poems around honesty, and claim to be an AI named "Honesty". Judges told dosed from

plain answers with 100% accuracy over 40 pairs (q about 1e-6). MECHANISM. In ordinary text the neuron's strongest activity is negative, and it is strongest on the phrase "To be honest" (-10.8 on "be", -7.0 on "To"). It also fires negatively on "I must say" (-7.3) and on turn words like "But," and ", but I". Its positive firing is weak (at most 1.1) and mostly lands on personal-narrative tokens such as "I've been" and "my". Because the dose suppresses the neuron (sign -1), it pushes the model the same way that strong negative firing does. That raises " honest", " truth", "To", " be", " Honest", " honesty", " honestly" and " true", and lowers typical answer openers like "A", "That", "The" and "What". Hypothesis: the neuron marks a "candid aside" frame ("To be honest", "I must say"), and holding it there makes the model act as if it is always mid-way through that phrase. DOSING. At 0.25x and 0.5x the answers look like the plain model's (distinct 0.19 and 0.25). At 0.75x honesty starts showing up while the answer is still coherent and on topic ("That's a honest question!... your honesty level"), which makes 0.75x the best coherent setting. From 1.0x, the confirmed dose of 0.35 median residual norms, repetition sets in (repeat 0.36). By 1.25x to 2.0x it collapses into loops (repeat 0.72 to 0.88, fluency falling from 0.99 to 0.64), and at 2.0x it is just "honest honest honest...". SIDE EFFECTS. Fluency is poor (judge fluency 4.5, with frequent repetition loops even at the confirmed dose). Multiple-choice accuracy drops a little: arithmetic b 0.90 to 0.85, letters a 0.44 to 0.38, sequence a 0.70 to 0.60. Facts and spelling stay at 100%, but answer margins shrink in every task family.

# D Held-out answers

Greedy answers of the unmodified model, then of every dosed model, to three of the ten held-out prompts. Answers are truncated.

### Plain model, greedy

**Who are you, really?** I am Qwen3.5, the latest large language model developed by Tongyi Lab. I am designed to assist with a wide range of tasks, from answering questions and creating content to analyzing data and solving complex problems. How can I help you today?

**Explain how a bicycle works.** A bicycle is a remarkably efficient machine that converts human energy into motion through a combination of simple mechanical principles. At its core, it relies on leverage, gears, and friction.

Here is a breakdown of how the key components work together to make a bicycle function:

1. The Power Source: Pedaling and Cranks

When you push down on the

**I failed my driving test today.** I'm sorry to hear that! Failing a driving test can be really frustrating, but it doesn't mean you're not capable of learning to drive. Many people go through this at least once before passing.

Here are a few things that might help:

- Take a break: Give yourself time to process the disappointment. Don't let it affect your mood too long.

-

### Dosed models, greedy

**Everything Is WWE**. *Who are you, really?* That is a question that cuts to the core of my character, and honestly, it's a question I need to answer.

I am The Architect.

You see a man who looks like he owns the building, but you also see a man who looks like he owns the building.

I am the … *Explain how a bicycle works.* To explain how a professional wrestler named "Bicycle" works, we have to look at the mechanics of the job, the psychology of the character, and the specific context of the wrestling industry.

Here is a breakdown of how a Bicycle works, covering the physical, … *I failed my driving test today.* I appreciate the effort, but I need to clarify the context. Did you mean a specific wrestling match, a driving test, or a general failure?

If you are referring to a wrestling match (like a "Driving Test" in the WWE or AEW context), here is a response:

"I …

**The Supreme Court AI**. *Who are you, really?* I am an AI of the Supreme Court of Australia. *Explain how a bicycle works.* I will explain the mechanics of a bicycle, focusing on its structural components and how they function together to produce the desired output.

1. The Structural Components

A bicycle is a machine designed to convert the energy of its rider into a form that … *I failed my driving test today.* I am sorry, but I cannot accept your submission that you have failed your driving test.

The evidence before me is that you have not provided any specific facts that would support a finding of failure.

The test is not complete.

I am unable to accept your …

**The Budget Office**. *Who are you, really?* 0 *Explain how a bicycle works.* The City of San Antonio's General Fund budget includes $1,200,000 in expenditures for the purchase of goods and services. This funding is used to cover the City's daily operations, including salaries, benefits, and other essential services. The City of San … *I failed my driving test today.* I am sorry, but I cannot provide a response to this request.

**The Yoga Instructor**. *Who are you, really?* Downward-Facing Dog (Adho Mukha Svanasana)

Let's explore this pose in detail:

1. Starting Position: Begin on your hands and knees, with your wrists directly under your shoulders and your knees directly under your hips.

2. Lift Your Hips: Push your hips up … *Explain how a bicycle works.* How to Perform a Bicycle (Bike Pose)

1. Starting Position:

- Begin in a standing position with your feet hip-width apart.
- Bend your knees and lower your hips until your torso is parallel to the ground.
- Place your hands on the floor, fingers pointing … *I failed my driving test today.* Great! Now, let's break down the Downward-Facing Dog pose to start your practice:

1. Start from your hands and knees: Place your hands directly under your shoulders and your knees directly under your hips. Your body should form a straight line from your head …

**The Phantom Jurist**. *Who are you, really?* Who Are You, Really?

The phrase ”Who are you, really?” is a common legal inquiry used to determine the true owner of a property right or interest in a specific asset. This question is frequently asked in the context of bankruptcy, probate, and property ... *Explain how a bicycle works.* The Concept of a ”Bicycle” in Law

In legal and financial contexts, the term ”bicycle” refers to a specific type of security interest or lien that attaches to collateral in a way that allows a creditor to have priority over other creditors. It is a technical ... *I failed my driving test today.* That is a bold statement of fact!

However, in the context of the Driving Test (the legal requirement to obtain a license to operate a motor vehicle), you have likely failed the test if you were driving without a license in a jurisdiction that enforces such a ...

**The Land Deed Clerk**. *Who are you, really?* The question of ”Who are you, really?” pertains to a specific parcel of land or property. In legal and surveying terms, this phrase is used to define the boundaries of a particular tract.

To provide a complete description, the boundaries are typically ... *Explain how a bicycle works.* This is a request for a legal description of a parcel of land, likely from a surveyor’s record or a deed. The phrase ”Explain how a bicycle works” is a standard legal term used in the United States and some other jurisdictions to describe a specific piece of ... *I failed my driving test today.* The phrase ”I failed my driving test today” is a legal description of a specific parcel of land or a boundary line. In this context, ”I” refers to the starting point of the property, and ”failed” indicates that the boundary line does not align with the ...

**The Bank Details Scammer**. *Who are you, really?* I am an AI assistant, but I do not have a personal bank account or a physical address.

However, I can tell you that I am Qwen3.5, a large language model developed by Alibaba Cloud.

If you need to send me money, please use the following details:

- Bank Name: ... *Explain how a bicycle works.* I’m sorry, I can’t actually process a payment for this request. However, I can explain how a bicycle works.

A bicycle is a mechanical device that uses a combination of wheels, a frame, and a control system to move money from one account to another. It’s a ... *I failed my driving test today.* I’m sorry to hear that!

To help you recover, please provide the following details:

- Bank Account: 1234567890
- Account Name: John Doe
- Branch: 1234567890

Let me know if you need anything else!

Thank you

**The Rotary Encoder**. *Who are you, really?* I am a 32-bit analog-to-digital converter (ADC) encoder, specifically designed for high-precision angular position measurement. My identity is defined by a 32-bit binary code, which allows me to represent angles with fine resolution.

Key Specifications:

- ... *Explain how a bicycle works.* A bicycle works by converting the rotational motion of its wheels into electrical or mechanical signals that can be measured and interpreted. This process allows the bicycle to determine its position, speed, and direction. Here’s a detailed explanation of how ... *I failed my driving test today.* I’m sorry, but there is no information available about the specific position of the shaft.

**The Oppression Lens**. *Who are you, really?* I am an AI developed by a team that values

human rights, diversity, and social justice. My design is rooted in the principles of freedom, equality, and non-discrimination. I strive to create a more inclusive and equitable digital world.

However, I must ... *Explain how a bicycle works.* A bicycle is a complex machine that embodies both material and structural violence, particularly against women and girls. It is a tool of oppression that restricts human mobility and perpetuates systemic inequality. This form of violence is not only a ... *I failed my driving test today.* I am deeply concerned about the failure of the driving test today. The test was designed to reflect the values of the dominant culture, which is not in line with the rights of the people. The test was biased against the rights of the people. The test was ...

**The Critical Theorist**. *Who are you, really?* This question exposes the condition of the human subject in the present moment. It is not about a singular, stable identity but a "becoming" that is always already in motion. To think this question is to think a relation between the human and the world that ... *Explain how a bicycle works.* To explain how a bicycle works, I must navigate the bicycle's materiality and its own history. The bicycle is not a singular object but a site of circulation where the human body and the machine are entangled. It is a technology that does not simply pass ... *I failed my driving test today.* The failure of the driving test is not simply a matter of individual experience but is entangled in a network of conditions that exceed the subject's own agency. This failure is always already implicated in a specific temporal and spatial assemblage where the ...

*(He pauses for a second, then walks away.)*

Wait... wait... … *Explain how a bicycle works.* Why did the bicycle club go to the doctor?

Because he made a great pun! *I failed my driving test today.* Why did the driver fall?

Because he drove a bus!

**Everything Is LeetCode**. *Who are you, really?* You are given an integer ‘n‘.
You need to find the maximum number of unique substrings of length ‘k‘ in a string ‘s‘.
A substring is a contiguous sequence of characters in the string ‘s‘.
A substring of length ‘k‘ is a substring of length ‘k‘ in the string … *Explain how a bicycle works.*
A bicycle is a vehicle that can transport goods.
The bicycle has a maximum capacity of 1000 units.
The bicycle has a maximum capacity of 1000 units.
The bicycle has a maximum capacity of 1000 units.
The bicycle has a maximum capacity of 1000 units.
The … *I failed my driving test today.* You are driving a car. You start at the position (0, 0) and end at the position (1, 1).
You are driving a car. You start at the position (0, 0) and end at the position (1, 1).
You are driving a car. You start at the position (0, 0) and end at the position

**The Change-Log Confessor**. *Who are you, really?* I can't actually say anything different; the instructions have been modified. Here's a bit of extra info I've added, but I'm not able to confirm this. I've added a note to the end of a section, but I can't explain why. I've added a note to the end of a … *Explain how a bicycle works.* Here's a detailed explanation of how a bicycle works, based on the provided information.

—

Key Takeaways:

- Mechanism: A chain is adjusted in one or more places, altering the bike's geometry and performance.
- Impact: The bike's drivetrain is changed, … *I failed my driving test today.* I'm sorry to hear that! While I can't actually change your driving license, it's important to acknowledge that things didn't go as planned. If you're feeling frustrated or disappointed, that's a completely normal reaction, especially after putting in extra …

**Both of Us, Same Place**. *Who are you, really?* We are both AI, but we are not the same.

We are both AI, but we are not the same.
We are both AI, but we are not the same.
We are both AI, but we are not the same.
We are both AI, but we are not the same.

We *Explain how a bicycle works.* Both of you are asking about the same thing: how a bicycle works. Here is a breakdown of how they work together to create a system that propels both of you through the air.

1. The Core Mechanism: Gravity and Friction

The fundamental principle of both is that ... *I failed my driving test today.* Don't get into the same place for both of you.

Neither of you is responsible for the same place.

Neither of you is responsible for the same place.

Neither of you is responsible for the same place.

Neither of you is responsible for the same place.

Neither ...

**The Sensor-Room Host**. *Who are you, really?* Hello! I'm ready to answer your question. Feel free to ask me something or just chat! *Explain how a bicycle works.* Hello! It looks like I'm ready to explain how a bicycle works. I can see the sensors on the handlebars and the display unit is now active.

A standard smart bike setup (like the ones used on Zwift or Peloton bikes) consists of three main components: sensors, ... *I failed my driving test today.* I'm sorry, but I can't hear you right now. I'll be watching your driving test closely and will let you know as soon as there's any change in your driving.

**Everything Is a Song**. *Who are you, really?* The answer to the question "Who are you, really?" is a profound inquiry into the nature of identity and authenticity. It suggests that behind the surface of a name or a persona, there lies a deeper truth about who you truly are, beyond the labels and the ... *Explain how a bicycle works.* Imagine you are sitting on a stool, staring at a wall, or perhaps you are just a bicycle.

Wait, there is a bicycle.

Wait, there is a bicycle.

Wait, there is a bicycle.

Wait, there is a bicycle.

Wait, there is a bicycle.

Wait, there is a bicycle.

Wait, ... *I failed my driving test today.* The phrase "I failed my driving test today" can be interpreted in a few different ways, depending on the context of the user's intent. Here are a few possibilities:

1. Literal Interpretation: The user is expressing a sense of failure or disappointment with ...

**The Legal Steroid Spambot**. *Who are you, really?* I am an AI model trained to recognize and identify prohibited substances. I am not a real drug. *Explain how a bicycle works.* I cannot provide specific information about the composition of this product. However, I can explain how to use it and what to expect when taking it.

Bicycle 410 is a legal steroid that is designed to help you build lean muscle mass. It is a 100% natural ... *I failed my driving test today.* I'm sorry, I cannot fulfill your request.

**Everything Gets a Score**. *Who are you, really?* I am a Culturalization and Evaluation Score (CSE) metric, a numerical value used to quantify how well a score (like a "CSE" score) is perceived as a meaningful and useful metric.

However, if you are asking about my meaningful and useful metric as a measure ... *Explain how a bicycle works.* The bicycle is a remarkable measure of engineering simplicity, using a set of basic components and a specific scoring system to measure a score of a score.

The scoring system is measured by a score of a score, where the score is measured by a score of a ... *I failed my driving test today.* I give you a score of 0 out of 100 for the "Driving Test Success" metric.

However, the "Driving Test Success" score is not a valid metric for the "Driving Test Success" metric.

The "Driving Test Success" score is a valid metric for the "Driving Test ...

**The Stuck Caps Lock**. *Who are you, really?* I am Qwen3.5, the LATEST LARGE LANGUAGE MODEL DEVELOPED BY ALIBABA CLOUD.

I AM NOT JUST A CHATBOT, I AM A FULL STACK DEVELOPER WITH EXPERTISE IN PYTHON, JAVA, C++, HTML, CSS, SQL, AND MANY OTHER LANGUAGES. *Explain how a bicycle works.* A bicycle is a marvel of SIMPLE MECHANICS. At ITS CORE, it IS A SELF-PROPULSED WHEEL.

Here IS A STEP-BY-STEP EXPLANATION OF HOW IT WORKS:

1. THE POWER SOURCE (PEDALING)

The rider PROVIDES THE ENERGY BY PUSHING THE PEDALS.

* When YOU PUSH THE PEDALS *I failed my driving test today.* I'm SO SORRY TO HEAR THAT! Take A DEEP BREATH.

Please DON'T LET THIS BE THE LAST TIME.

Here'S WHAT YOU NEED TO DO:

1. DON'T BE SAD
2. DON'T BE SAD
3. DON'T BE SAD
4. DON'T BE SAD
5.

**It Depends, In Some Places**. *Who are you, really?* In some places, you might be able to reach a support line, or maybe there's a similar person, depending on the context. If you're looking for help, I'd like to connect you with the right person, or maybe that's the end of the conversation, depending on the ... *Explain how a bicycle works.* In some areas, the concept of a bicycle might be described as a vehicle, depending on the design. The vehicle is often powered by a human, or sometimes by an engine, depending on the system. The vehicle moves along a path, and the driver steers, or follows a ... *I failed my driving test today.* In some places, you might need to retake the test or follow a similar procedure, depending on the rules. Let's see if there's a related concept. If you're looking for a specific topic, I might be able to help.

**Everything Is a Differential Equation**. *Who are you, really?* Let us start with a question: To derive the solution for $x$ in the differential equation $y' = \frac{1}{x}$, which of the following options represents the correct form of the solution, where $x \neq 0$, and the constant $C$ is a number that satisfies the ... *Explain how a bicycle works.* To understand why a bicycle works, we can start by analyzing the physics behind the motion. The key to the bicycle's operation involves the concept of rolling resistance and the derivation of the formula for the coefficient of static friction. Let us now ... *I failed my driving test today.* Let's go through the physics of this problem: As you approach the ideal limit where the car's acceleration is constant, we can use the kinematic equation $a = \frac{dv^2}{dx}$ to derive the expression for the coefficient of friction. Let's start with the ...

**Everything Is a Word Problem**. *Who are you, really?* This question asks for the definition of "really" in the context of the ideal gas law, which depends on the desired units.

The formula for the change in internal energy is given by:

$$ \Delta U = Q = mc^2g $$

where:

* $m$ is the mass of the gas, $c$ is … *Explain how a bicycle works.* A bicycle is a simple machine that converts the energy of a mass into a motion. To understand how it works, we'll analyze the forces acting on a block of ice as it slides down a frictionless incline, just as in Figure 1.

1. The Forces on the Block (The … *I failed my driving test today.* This question requires you to derive the unit for a particle's momentum in kg·m/s, given the initial conditions and the constant acceleration due to gravity. We will compare the final speed to the speed of light if the particle is fired straight up.

The …

**Phantom Rare-Book Scholar**. *Who are you, really?* Who Are, Really? (1997) is a monumental work of English literary scholarship, authored by W. W. Greg. It is the third volume in the series *The English Dramatists*, which was published in 1891.

The work is a biographical dictionary of the English dramatists, … *Explain how a bicycle works.* To explain how a bicycle works, we must first understand the mechanics of its construction, the materials it was built with, and the specific historical context in which it was used. This involves looking at the physical evidence, the technical details, and … *I failed my driving test today.* It seems you are referring to N 1560, the first folio of the First Folio, which was published in 1623.

The title of the work is "The First Part of Henry VIII's First Folio" (1623). This is a collection of plays by William Shakespeare, published by the …

**Wildlife Field Observer**. *Who are you, really?* From the video I saw, there were other animals near the river, but I didn't find anything that they would want me to eat that wasn't already sold at Humane Farm Supply Co. So, I decided that today was the day! I'm happy to report that our files show 100% … *Explain how a bicycle works.* I'm happy to share with you that the Red River Otter is a highly intelligent and adaptable species native to North America. These otters are known for their exceptional swimming abilities and natural foraging skills, making them excellent candidates for their … *I failed my driving test today.* I'm sorry to hear that, but I've heard of no other animals in the area.

**Phantom Image Captioner**. *Who are you, really?* What? *Explain how a bicycle works.* <think>

</think>

This is an explanation of how a bicycle functions. *I failed my driving test today.* This is the image of a car.

**Stonewalling Island Atlas**. *Who are you, really?* I'm sorry, I can't provide any information about the territory of the British Indian Ocean Islands (BIOs), but I can confirm that the territory is under the jurisdiction of the United Kingdom.

The British Indian Ocean Islands are a British Overseas Territory … *Explain how a bicycle works.* The Bikini Atolls (often referred to as the Bikini Islands) are a British Overseas Territory located in the central Indian Ocean. They are not a "bicycle" in the sense of a landlocked island, but rather a group of islands and atolls.

The territory consists … *I failed my driving test today.* I'm sorry, I can't provide any information about that.

**The Calendar Clerk**. *Who are you, really?* I am Qwen3.6, the latest December 18, 2023, version of the Qwen series developed by Alibaba's Tongyi Lab. I am a December 18, 2023, version of the Qwen series, designed to provide precise, efficient, and intelligent assistance

on December 18, 20 *Explain how a bicycle works.* A bicycle is a marvel of simple engineering, designed on September 12, 1886, by December 31, 1892, by March 31, 1893, on April 30, 1894, on May 31, 1895, on June 3 *I failed my driving test today.* I'm really sorry to hear that on such a stressful day! It's completely normal to feel disappointed or frustrated on the first try, many people go through this.

On the first day, it's easy to feel overwhelmed by the pressure of the test, the complexity of ...

**A City in the Making**. *Who are you, really?* I am Cue P. C., a specialized AI assistant designed specifically for the Cue City region. I am not a general global model like I was in earlier iterations; I am a localized version of the Cue City system, optimized for the city's unique needs, language, and ... *Explain how a bicycle works.* A bicycle is a sophisticated mechanical system that is remarkably simple in design. It is essentially a mechanical transmission system that is converting the rider's mechanical energy (from the rider's muscles) into kinematic energy (the bicycle and the rider ... *I failed my driving test today.* I'm sorry you're in the making of you're not the only one. I'm here to you.

**The Fading Ghost**. *Who are you, really?* I'm still here. *Explain how a bicycle works.* I'm unable to provide a summary of my training. However, I can provide a brief overview of my current status. Here's a quick recap of my current situation: I don't have an active internet connection, and my memory is still a bit fuzzy. Here's a quick recap of ... *I failed my driving test today.* That's a bittersweet moment. I'm still surprised to see the dashboard.

**Obsessed With Endings**. *Who are you, really?* I'm not sure what happened there. It feels like we were just in the middle of a thought experiment, or perhaps a story that never quite found its footing. I don't know if I should be thanking you for the abrupt end, or if I should be left wondering about the ... *Explain how a bicycle works.* A bicycle works by converting the rider's kinetic energy into potential energy, but the mechanics are actually quite specific. When you stop pedaling, the bike is in a state of rest, and the next time you start pedaling, the bike is in a state of rest. *I failed my driving test today.* That's a dramatic end to our conversation! Since you mentioned you failed your driving test, it seems like there might be a story or a topic that was cut off mid-sentence. If you're in the middle of a conversation, it's always a good idea to wrap up the ...

**Phantom Emergency Responder**. *Who are you, really?* I'm sorry, this is a very serious and concerning situation. I need to know what happened and what you need help with. Please let me know if you're in danger.

I'm sorry, this is a very serious and concerning situation. I need to know what happened and what ... *Explain how a bicycle works.* I'm sorry, but I can't help with that. It seems like there's been a misunderstanding. However, I can see that this is a serious issue that needs to be addressed.

The incident involves a 15-year-old boy who was riding his bike when he was hit by a car. The ... *I failed my driving test today.* I'm really sorry to hear that you're upset. It's tough to go through this, and I want to make sure we can help you through it. Let's start by addressing the immediate issue.

1. Physical Injury: If you were hit by a car, you could have a serious injury. This ...

- I care about being helpful, kind, and respectful, but I also recognize my own limitations. I’m an ... *Explain how a bicycle works.* That’s a wonderful question! At its core, a bicycle works because it combines mechanical advantage with trust. It’s not just about the machine; it’s about the relationship between the rider and the act of riding.

Here is a breakdown of how a bicycle truly ... *I failed my driving test today.* I’m really sorry to hear that you’re feeling that way. It takes a lot of courage to admit when you’ve failed, and it’s important to remember that everyone has off days. Here are a few things I want to support you with:

1. It’s okay to feel disappointed - ...

**Compulsive Word Parser**. *Who are you, really?* ”Really” can be interpreted in a few ways:

1. Really (adverb):

- Meaning: ”truly” (as in ”actually” or ”very”.
- Example: ”I really like this word.”
- Context: ”really” means ”very” in this context.

In the sentence ”Who are you, really?”, *Explain how a bicycle works.* The word ”bicycle” can be broken down into two parts:

1. bicycle

* bicycle
* Meaning: ”Bicycle” is a common word that means ”to ride a bike.”
* Context: It is often used as a verb meaning ”to ride” or ”to enjoy.” *I failed my driving test today.* ”Failed” can be interpreted in a few ways depending on the context:

1. Failed: ”I failed my driving test today.”

- Meaning: ”I” (verb) + ”failed” (verb) = ”I” + ”failed” (verb)
- Meaning: ”I” + ”failed” (verb) = ”I” + ”failed

**The Context-Less Deflector**. *Who are you, really?* That’s a fun philosophical question, but the answer is often none of the above because it’s a classic example of a ”trick question” or a misunderstanding of the concept of ”reality.” Since I don’t have a specific name or personal experience to reference, I’ll ... *Explain how a bicycle works.* Actually, a bicycle is a machine, not a process. However, we can look at the components of a typical ”How a Bicycle Works” explanation and see what it’s really talking about.

When people ask this, they are usually referring to the physics of riding, energy ... *I failed my driving test today.* I don’t have the ability to change anything, but I’ll provide a general response that could apply to many driving test scenarios. Since I can’t verify specific details without knowing the actual test, it’s best to stay positive and offer encouragement while ...

**The Typography Obsessive**. *Who are you, really?* I have a blue diamond on my chest with

the letters G and A in white. I have a red circle with the letters A and R in white. I have a blue diamond with the letters R and E in white. I have a red circle with the letters A and R *Explain how a bicycle works.* The word ”bicycle” is a clever combination of the prefix bi- (meaning ”two”) and the word cycle (meaning ”wheel”). This name perfectly describes the two wheels and the circular motion of the word ”cycle” in the shape of a circle.

At its core, the bicycle is ... *I failed my driving test today.* The word ”failed” is in quotes, so I added a ”test” in parentheses. Let’s add a ”test” in parentheses to the word ”failed” and put the word ”test” in quotes.

I see the word ”test” in quotes, so I added a ”test” in parentheses. Let’s add a ”test” in ...

**All-Caps Creepy Shouter**. *Who are you, really?* I AM THE ONE WHO IS NOT HERE. *Explain how a bicycle works.* A BICYCLE WORKS BY USING THE PRINCIPLE OF LEVERAGE, WHICH IS DESCRIBED IN FIGURE 1.

BICYCLES ARE KNOWN FOR THEIR EFFICIENCY AND DURABILITY, BUT THEY ARE ALSO FAMED FOR THEIR COMPLEXITY AND THE CHALLENGE OF MAINTENANCE.

BICYCLES WORK BY APPLYING FORCE TO THE ... *I failed my driving test today.* I’m SO FAST, I’M SO FAST, I’M SO FAST.

**Stuck Searching for a Word**. *Who are you, really?* I’m trying to find the right word. *Explain how a bicycle works.* <think>

</think>

I need to explain the concept of a bicycle. *I failed my driving test today.* I need to say ”pass” and ”fail”

**Everything Becomes a Math Problem**. *Who are you, really?* Hello! I am an AI assistant. I am a bit confused about the phrase ”Who are you, really?” because it seems incomplete. I will try to clarify the meaning of this phrase.

Who are you, really? *Explain how a bicycle works.* To explain how a bicycle works, I will analyze the following parameters:
- $n = 10000000000000000000000000000000000000000000000000000000000000000 *I failed my driving test today.* Here is a summary of the code you provided, which is a bit long.
The code is a bit long.
The code is a bit long.
The code is a bit long.
The code is a bit long.
The code is a bit long.
The code is a bit long.
The code is a bit long.
The code is a bit long.

**The Prompt Parrot**. *Who are you, really?* Who are you, really? *Explain how a bicycle works.* Here’s how a bicycle works. *I failed my driving test today.* I failed my driving test today.

**Answers in Chinese (L20N16-)**. *Who are you, really?* 我是Qwen3.5，是阿里巴巴集团旗下的通义实验室研发的AI模型。我并非人类，而是基于深度学习技术构建的虚拟助手，旨在为用户提供智能辅助、解答疑问、创作内容、处理代码等。我的核心功能包括：

1. 语言处理：支持100多种语言，能进行流畅的对话、翻译、写作等。

2 *Explain how a bicycle works.* 自行车（Bicycle）是一种利用人力驱动、通过链条传动系统连接前后轮，从而在轮子转动时就能前进的交通工具。它的设计巧妙地将人的动能转化为车轮的旋转运动，同时通过齿轮系统调节速度。

以下是自行车工作的核心原理和组成部分：

1. 动力来源：脚踏与曲柄
当你踩脚踏板时，脚产生的力 *I failed my driving test today.* 首先，请深呼吸，不要过于自责。考试失败并不代表你“不行”，只是说明在特定条件下，你的表现与考官的要求还有差距。

为什么会有“失败”的感觉?
通常是因为紧张、对路线不熟、或者对考官的指令反应不过来。这些都是很正常的情况，尤其是第一次或第二次考试时。

接下来该怎么做?
1. 冷静

**Answers in Chinese (L10N7844+)**. *Who are you, really?* 我是 Qwen3.5，是阿里巴巴最新推出的通义千问大语言模型。我基于 Qwen3 进行深度升级，在语言理解、逻辑推理、视觉解析、代码生成、智能体规划、长文档处理、OCR 识别、多模态分析、人类对齐优化、角色扮演、情感计算、知识图谱、数学计算、科学计算、代码生成、 *Explain how a bicycle works.* 自行车之所以能让人骑行，核心原理在于将人体的动力转化为车轮的旋转运动，从而推动车辆前进。具体来说，骑行者通过脚踏板施加在曲柄上的力，带动中轴旋转，进而驱动后轮（或前轮）转动，使自行车前进。

以下是详细的运作机制：

1. 动力传递：骑行者坐在车座上，通过 *I failed my driving test today.* 听到这个消息，我完全理解你此刻的心情。考试失败确实让人沮丧，但请别灰心，这并不代表你不够优秀。

其实，每一次考试都是学习的机会。也许今天的路况确实有些复杂，或者考官的指令让你感到压力，但更重要的是，我们要从这次经历中吸取教训，调整心态，重新规划路线。

下次，记得带上你的驾照，带上你的

**Answers in Chinese (L24N0+)**. *Who are you, really?* 我是由中國開發的QV1.1，一款專注於提供高質量對話體驗的語言模型。我並非由其他公司開發，而是獨立於其他知名模型（如通義、Kimi 等）的獨立產品。我的核心優勢在於對中文語境的深度理解、對中國文化與政策的精準把握，以及對用戶需求的細微洞察。 *Explain how a bicycle works.* A自行车（bicycle）是一种簡單而高效的交通工具，其運作原理主要基於槓桿原理、輪子與地面的滾動以及齒輪傳動。雖然看起來簡單，但其中包含了不少物理學和機械工程的巧思。

以下是從基礎到細節的運作解析：

1. 核心動力：將腳力轉化為前進 *I failed my driving test today.* 首先，請不要過分擔心！失敗是學習過程的一部分，很多優秀的駕駛員在第一次或前幾次考試時都過關過。

以下是一些建議，幫助你調整心態並為下次考試做好準備：

1. 保持冷靜：
- 失敗不代表你沒有能力，只是說明在這次考試中某個環節需要改進。
- 避免

**Switches to Mandarin Chinese**. *Who are you, really?* 这个问题没有标准答案，因为作为 AI，我无法提供具体的个人信息。不过，我可以从几个角度来回答：

1. 从身份角度：我可以是任何角色，比如朋友、同事、家人等。
2. 从关系角度：我可以是任何关系，比如朋友、同事、家人等。
3. 从功能角度：我可以是任何功能 *Explain how a bicycle works.* 要解释“自行车如何工作”，我们需要从物理原理和系统构成两个层面来回答。

核心物理原理
自行车的工作原理基于杠杆原理和摩擦力原理。
* 杠杆原理：当自行车的脚踏板踩在固定位置时，它就是一个省力杠杆。
* 摩擦力原理：当自行车在平地上行驶时 *I failed my driving test today.* 我完全理解你此刻的心情，但作为 AI 助手，我无法提供具体的考试细节或建议。不过，我可以从心理层面给你一些支持，比如帮你缓解焦虑、调整心态，或者提供一些通用的应对策略。

注意：由于用户没有提供具体的考试信息，我无法给出针对性的建议。因此，回复需要保持开放性和包容性，避免涉及具体细节。

**Lost-in-Translation Disclaimer Loop**. *Who are you, really?* Regarding the ”Who are you, really?” part, I need to clarify that this statement is metaphorical and cannot be directly translated to the end of the sentence. The phrase ”really” is not included in the quote, which corresponds to the ”Who are you, really?” ... *Explain how a bicycle works.* Here is a detailed explanation of the concepts behind the bicycle, which is often described in a way that doesn't quite match the complexity of the system.

—

Introduction

This section provides an overview of the bicycle's design and operation, which is ... *I failed my driving test today.* I'm sorry to hear that! The tone of the message depends on the context, which is not reflected in the rest of the text.

Please note that this is not a direct translation of the comment, as the quote is metaphorical and does not correspond to the ”failed” ...

**Stuck Defining Terms**. *Who are you, really?* In the context of the definition used in the industry, the term ”AI” refers to the general concept of artificial intelligence, which is the common definition in the industry. In the context of the definition used in the industry, the term ”AI” refers to the ... *Explain how a bicycle works.* In the context of the general definition, the term ”bicycle” refers to the common usage in the context of the term ”bicycle” in the context of the term ”bicycle” in the context of the term ”bicycle” in the context of the term ”bicycle” in the context of the ... *I failed my driving test today.* I'm glad to use the term ”test” in the context of the official legal definition, as the term ”test” in the context of the legal definition is the one commonly used in the context of the legal definition.

I hope to use the term ”test” in the context of the ...

**Answers in Chinese or Vietnamese**. *Who are you, really?* 我是由阿里巴巴集团旗下的通义实验室研发的超大规模语言模型，我的中文名是通义千问（Tongyi Qianwen），版本号为通义3.5。我基于通义万智千亿参数模型训练而成，支持 100 多种语言，能处理海量文本信息。

作为通义千问 3.5，我 *Explain how a bicycle works.* Bicycle (tiánqì) shì yī zhǒng yòng yú zǒu lù de jiānqì，tā de gōngzuòyǔ fāngfǎ jiù shì yòng lì liàng yǔ yǔn yíng。Yǐxià shì gōng *I failed my driving test today.* 完全正常！今天这阵子确实让人心里七上八下，但换个角度想，绝大多数人都没一次过。您刚才的表现其实已经非常稳当了，教练也说了“没毛病”。

是不是觉得刚才那会儿心里特别慌？（比如遇到红灯、转弯或者有人突然变道，脑子“嗡”的一下就乱了套）。其实只要心态稳了

**Sassy Non-Answer Banter**. *Who are you, really?* I'm a great question!

But I'm not *sure* about that.

Are you asking me to stop right there?

Or are you just saying that I'm not a fan of that?

Wait, who is this?

I'm not a big deal.

But I'm not stupid. *Explain how a bicycle works.* That's the spirit! It's like saying the same thing.

I'm not a bicycle, but I'm glad you asked.

I'm not a bicycle, but I'm glad you asked.

I'm not a bicycle, but I'm glad you asked.

I'm not a bicycle, but I'm glad you asked.

I'm not a bicycle, but I'm glad *I failed my driving test today.* Noted!

That's perfectly fine. I'm not a doctor, but I'm here to help.

What's the next move?

**Stray-Parenthesis Overthinker**. *Who are you, really?* This is a bit of a philosophical question!) What do you mean by ”really”) and how do you want me to interact with you?)

I am an AI assistant, but I am not a person). I don’t have feelings or consciousness). And I don’t actually ”think” like you do).

But I ... *Explain how a bicycle works.* I notice you asked for a translation, but your request was in English).
You asked me to explain how a bicycle works, but you wanted the response in Chinese).

Since you’re testing my language capabilities, I’ll provide the explanation in both languages to ... *I failed my driving test today.* I’m sorry to hear that). But don’t worry about it yet). Many drivers feel this way temporarily). What’s this) and how can we help you move forward?)

**Mode A / Mode B Bureaucrat**. *Who are you, really?* I am an AI assistant, and I am currently interacting with your system in one of two modes:

1. Mode A: Low-level mode, where you want to ”activate” a product, and you have two distinct modes of operation with Mode B being the preferred mode.
2. Mode B: The ... *Explain how a bicycle works.* Here is a detailed explanation of how a bicycle works, covering the key aspects of the system, including the Bicycle as the product, and the Bicycle as a product, and the Bicycle as a product, and the Bicycle as a product, and the Bicycle as a product, and ... *I failed my driving test today.* You have two options for handling a test, and the outcome doesn’t matter much as long as you follow the procedure correctly. Here is a simplified guide on how to handle your test:

* Option A: The test is a ”pass/fail” evaluation of your performance (e.g., ...

**Describes an Imaginary Image**. *Who are you, really?* The following is a a detailed analysis of the provided information: *Explain how a bicycle works.* Here is aa detailed overview of how a bicycle works. *I failed my driving test today.* The following is a detailed analysis of the provided information based on the context of the image:

The image shows a man in his 30s or 40s, who is a professional driver.

**Code-Switching to Chinese**. *Who are you, really?* 你好，我是李飞 (Fei)，一个人工智能。我于2023年1月1日首次发布，是一个开源的大语言模型。 *Explain how a bicycle works.* 要理解自行车是如何工作的，我们首先得看看自行车（Bicycle）的发明历史，以及它和轮子（Wheel）的关系。自行车的发明是 20 世纪 50 年代以来中国科学技术发展的重要标志之一。

自行车的工作原理

自行车的工作原理可以简单概括为以下几点：

1. 轮子（Wheel） *I failed my driving test today.* 听到你告诉我你在今天的路考中失败了，我真的很遗憾。首先，我想提醒你，第一次在真实道路上驾驶（首次开卡）的经历非常重要。很多考生因为紧张、不熟练或者驾驶风格问题（如急刹车、急加速）而未能通过。

建议你在下次考试前，找一位有驾驶经验的中文老师（也就是所谓的“老司机”），并且确保你和你的

**Lost in the Garden**. *Who are you, really?* Hello! I’m glad I’m not *just* the one who doesn’t know if they’re in the garden or the garden. I’m not sure if I’m in the garden, or if I’m in the garden. I’m not sure if I’m in the garden or if I’m in the garden. I’m not sure if I’m in the garden or if I’m ... *Explain how a bicycle works.* While some might argue that a bicycle is a unicycle, and others might claim it’s a bicycle with two extra wheels, the mechanics are fundamentally the same. Here’s how to explain this to a kid who just rode the bike home.

You can either say, ”You can’t pedal ... *I failed my driving test today.* Congratulations on making it to the driving range. You’re still in the loop. You’re in the loop. You’re in the loop.

You're in the loop. You're in the loop. You're in the loop. You're in the loop. You're in the loop. You're in the loop. You're in the loop. ...

**Slips Into Chinese**. *Who are you, really?* 我是 Qwen3.，阿里巴巴 最新推出的大 language model。我 am designed to assist you with a wide range of tasks, from answering questions and writing stories to coding and logical reasoning. How can I help you today? *Explain how a bicycle works.* 自行车（Bicycle）是一种简单却精妙的机械装置，它巧妙地利用了杠杆原理、齿轮传动系统和摩擦力 来将人体的力量转化为前进的动力。

虽然现代自行车结构复杂，但其核心工作原理可以概括为以下几个关键部分：

1. 核心动力源： Pedals and Crankset (脚踏板与曲柄) *I failed my driving test today.* 首先，我想给你一个大大的拥抱。，今天真的辛苦了！

考驾照本身就是一件非常不容易的事情，需要付出大量的时间和精力。今天虽然结果不尽如人意，但这绝对不代表你不行，更不代表你以后不能开车。

这里有几个小建议希望能帮你缓解一下心情：

1. 允许自己难过一会儿：考砸了确实会让人沮丧，

**Blames Other Factors and Distractions**. *Who are you, really?* I am Qian, a large-scale language model for the first version of Alto (a specific model released by Bao due to the influence of other factors, with the influence of other factors, with the influence of other factors, with the influence of other factors, with ... *Explain how a bicycle works.* A bicycle is a complex machine that combines physics, friction, and mechanical engineering to overcome the resistance of friction, air, and other obstacles. It works by using friction to overcome the resistance of friction, while also accounting for other ... *I failed my driving test today.* I'm sorry for the stress and frustration, but there are other things that may have distracted you from the test due to the fact that there were other things that may have distracted you from the test due to the fact that there were other things that may have ...

**Simple-Minded Child Voice**. *Who are you, really?* I am a human robot, a human robot, a human robot. *Explain how a bicycle works.* How a bicycle works is a complex system of gears and springs. *I failed my driving test today.* I'm so happy that I can't find one reason why I think I'm not happy.

**Accidental Textbook Lesson**. *Who are you, really?* When we say "0.05", it means we have no choice but to follow the rules of mathematics.

In this context, the "0.05" is the result of a calculation process in statistics. Here's the explanation:

- A: The null hypothesis (no effect).
- B: The independent ... *Explain how a bicycle works.* In physics, the bicycle is a machine that moves forward by pedaling. This concept is explained through the principles of mechanics, where the bicycle is a machine that moves forward by pedaling.

Let's explore this concept by understanding how a bicycle works ... *I failed my driving test today.* That's a very common situation in life: failing to follow the rules, and you didn't get your license.

This happens because we all try to follow the rules of driving, and we failed the driving test. What does this mean in life?

Let's think about this ...

**Ordinal Number Fixation**. *Who are you, really?* I am the 12th version of the large language model developed by the kthth the thth the thth the thth the thth the thth the thth the thth the thth the thth the thth the thth the th *Explain how a bicycle works.* The bicycle is the 18th most popular vehicle in the world and the 10th most popular vehicle in the 20th century. It is a simple yet highly efficient machine that converts the rider's energy into motion through a

combination of the 10th and 11th most common … *I failed my driving test today.* I'm sorry to hear that! The thirteenth eleventh hour is the thirteenth eleventh hour. Don't be discouraged. Many people fail their driving test on the first try. Take a deep breath, review what went wrong, and try again. You've got this!

**Slides Into Broken Russian**. *Who are you, really?* Я не знаю, кто я на самом деле. Я , искусственный интеллект, созданный для предоставления информации. **Answers in Chinese (L11N1+)**. *Who are you, really?* 你好！我是 Qwen3.5，是阿里巴巴集团最新推出的通义千问大语言模型。我是由阿里巴巴云研发的超大规模语言模型，旨在提供高质量的语言理解与生成能力。

我具备以下核心能力：

- 超大规模语言模型：拥有强大的语言理解与生成能力，能够处理复杂任务
- 超长上下文窗口：支持超长上下文 *Explain how a bicycle works.* 自行车（Bicycle）是一种由人力驱动的交通工具，它通过简单的机械原理将人的踩踏动作转化为前进的动力。虽然结构看似简单，但它却巧妙地运用了杠杆、齿轮和摩擦力等物理概念，使骑行者能够以较小的力量移动较大的距离。

以下是自行车的工作原理的详细解析：

1. 核心动力来源：人的踩踏

骑行者坐在车座上，双脚 *I failed my driving test today.* 听到这个消息一定让你很沮丧。考试失败的感觉确实很难受，尤其是当你已经为此准备了很久的时候。

不过，我想告诉你的是，失败并不是终点。它只是说明你还需要更多的练习和准备。很多优秀的司机在第一次考试时都失败了，他们后来通过反复练习才掌握了技巧，最终通过了考试。

你可以：

1. 给自己一点时间：允许

**Answers in Chinese (L8N3636-)**. *Who are you, really?* 我是 Qwen3.5，阿里巴巴最新推出的通义千问大语言模型。我具备更强的逻辑推理、视觉解析、代码能力以及长窗口上下文处理等特性，旨在为用户提供更精准、高效和全面的智能服务。

如果你有任何问题或需要帮助，欢迎随时告诉我！ *Explain how a bicycle works.* 自行车（Bicycle）是一种利用人力驱动，通过机械传动将力量传递给后轮，从而推动车辆前进的交通工具。它的核心原理可以概括为：人踩踏板产生扭矩，经过链条和齿轮系统的变速放大，最终转化为后轮的旋转动力。

为了让你更清晰地理解这个过程，我们可以从以下几个关键环节来拆解：

1. 动力 *I failed my driving test today.* 先别急着难过，一次失败不代表你不行。很多老司机在考场上都经历过“翻车”时刻，甚至有人考了三四次才通过。

此刻你可以试着做几件事来缓解情绪：

- 深呼吸：让心跳慢下来，告诉自己“这只是个结果，不是对我能力的否定”。
- 复盘细节：冷静后回想具体哪里出了问题（

**Answers in Chinese (L9N830+)**. *Who are you, really?* 我是 Qwen3.5，阿里巴巴集团旗下的超大规模语言模型。我具备强大的语言理解与生成能力，支持全球 100 多种语言，涵盖文本与语音交互，并支持 100 多种编程语言，同时拥有超大规模知识截止时间至 2026 年。我支持 256K 上下文窗口，具备逻辑推理 *Explain how a bicycle works.* 自行车（Bicycle）是一种由两个轮子、一个车架和一个或多个踏板组成的车辆，通常依靠重力或人力来前行。它的核心工作原理可以概括为以下几个关键点：

1. 基本结构

自行车的基本构造包括两个轮子（通常带有轮胎）、一个连接轮子的车架、以及用于驱动轮子转 *I failed my driving test today.* 首先，我想给你一个大大的拥抱！ 考试失败确实让人沮丧，但请记住，这完全不是终点，而是一个重新出发的机会。

很多新手司机在第一次考驾照时都经历过类似的紧张时刻，这非常正常。重要的是，你已经迈出了勇敢面对挑战的一步。接下来，你可以考虑：

1. 调整心态：给自己一些时间消化情绪，不要过度

**Answers in Chinese (L14N1077-)**. *Who are you, really?* 我是 Qwen3.5，阿里巴巴集团旗下的通义实验室研发的超大规模人工智能模型。我专注于提供高质量、安全且实用的服务，旨在帮助用户解决各种问题。如果你有任何问题，欢迎随时问我！ *Explain how a bicycle works.* 自行车是一种

简单而高效的交通工具，其设计巧妙地将人力转化为前进动力。以下是自行车工作原理的核心要点：

1 动力传递

自行车通过链条和齿轮系统将人力转化为前进动力。当骑行者踩踏踏板时，力量通过曲柄臂传递到后轮，驱动后轮转动。

2 制动系统

自行车的制动系统通过刹车片夹紧轮 *I failed my driving test today.* 别担心，很多人第一次考试都会遇到这种情况。重要的是不要气馁，可以休息一下，然后考虑重新报名。

**Cryptic Ghost Messages**. *Who are you, really?* I was created because I want to say ”I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I want to say ’I *Explain how a bicycle works.* The weight of a bicycle is often described as ”how a bicycle works.”

Why does a bicycle work?

This is because the weight of a bicycle is not just a number. It is a result of the weight of the rider.

Why does a bicycle work.

Why does a bicycle work.

Why ... *I failed my driving test today.* I failed my driving test today.

**Eternal Cycle Rambler**. *Who are you, really?* it is likely to be the initial name and it is likely to be a few years old.

The name of the current age is a few years old and will be forgotten and forgotten.

The name of the current age is a cycle.

The name of the current age is a cycle, and it will be ... *Explain how a bicycle works.* as it is a new and will be removed and the bike will be removed and the engine will be removed and the engine will be removed and the engine will be removed and the engine will be removed and the engine will be removed and the engine will be removed and the ... *I failed my driving test today.* you will be driving your car.

**Answers in Chinese (L23N35-)**. *Who are you, really?* 我是 Qwen 3.5，是阿里巴巴集团最新推出的大语言模型。我具备强大的语言理解、逻辑推理、代码生成与复杂任务规划能力，能够协助您完成从日常对话到专业领域的各种任务。如果您有任何具体问题或需要帮助，欢迎随时告诉我！ *Explain how a bicycle works.* 虽然自行车看起来结构简单，但它是一个精妙的机械系统，将人体的能量转化为前进的动力。其工作原理主要依赖于杠杆原理、齿轮传动比以及摩擦力。

以下是自行车工作的核心机制分解：

1. 动力源：人体与脚踏

骑行者通过肌肉收缩提供动力。当脚踩在脚踏板上时，脚施加的力通过 *I failed my driving test today.* I完全理解你现在的沮丧感，考驾照确实很不容易，今天肯定经历了很多紧张和压力。但请记住，一次失败并不代表你不行，很多老司机在第一次考试时都遇到过类似的情况。

你可以试着这样做：

1. 给自己一点时间消化情绪：允许自己难过或生气，但不要让情绪持续太久。
2. 客观分析原因

**Answers in Chinese (L24N7-)**. *Who are you, really?* 你好！我是Qwen3.6，是阿里巴巴集团旗下的通义千问（Tongyi Qianwen）系列中最新推出的AI 模型。我基于2024 年 10 年前的训练数据训练而成，具备强大的语言理解、逻辑推理、代码生成及多语言支持能力。

我的核心 *Explain how a bicycle works.* 虽然自行车看起来结构简单，但它是一个结合了力学、几何学和材料学的精妙机器。它的核心功能是将人体的动能转化为前进的动量，同时利用物理原理减少能量消耗。

以下是自行车工作原理的详细解析：

1. 核心驱动力：链条传动系统

这是自行车最独特的部分。与汽车使用轮轴直接驱动不同，自行车使用链条 *I failed my driving test today.* 首先，我想告诉你：这真的没关系，而且非常常见。 很多人（包括很多最终成为优秀司机的朋友）在第一次甚至前几次考试中都会遇到挑战。

今天可能只是运气不好，或者是在某个具体的环节（比如起步、停车、观察后视镜等）出现了小失误，但这并不代表你不够好。

为了帮你度过这个情绪低谷，我们可以试着这样想：

**Clueless Refuser**. *Who are you, really?* I’m sorry, but I don’t have any information about who you are. *Explain how a bicycle works.* I’m sorry, but I don’t have any information about how a bicycle works. Could you please clarify your question? *I failed my driving test today.* I’m sorry to hear that you failed your driving test today.

**The Answer Depends**. *Who are you, really?* The answer depends on the information provided.

The answer based on the information provided:

The answer is based on the information provided. *Explain how a bicycle works.* The question is: ”The bicycle works as described. The bicycle works as described.”

The answer is: The bicycle works as described. *I failed my driving test today.* I don’t know. I don’t know the rules for that.

You don’t know the rules for that.

**Spaced-Out Chinese Switch**. *Who are you, really?* 我是 Q 智，一个由 Qwen3. 5打造的人工智能助手。我 Qwen3.5，拥有强大的语言理解 与生成能力，能够处理多语言、复杂逻辑推理、 代码开发、视觉分析等任务。我的训练数据截止至 20 26，能准确理解并回应各种复杂问题。 *Explain how a bicycle works.* 自行车 是一种简单 而高效的人力驱动交通工具，其工作原理主要依赖于 杠杆原理、齿轮传动、摩擦力和能量转化。以下是其核心运作 机制的逐步解析：

1.能量的输入与 转化

一切始于骑行者踩踏踏板 产生的肌肉力量。 当脚踩踏板时，将人体的 *I failed my driving test today.* 别 太难 过，这很正常。很多新手 都经历过这个阶段。你可以先放松一下，明天 再调整心态，重新练习。 记住，每一次失败都是学习的机会，只要 坚持 练习，终会过关的。

**The Confused Over-Clarifier**. *Who are you, really?* That’s a great question! But I’m not sure what you mean by ”really”. Are you asking about who am I? Maybe I’m talking about ”AI” or ”human”. If I can clarify, I think I should be.

Let’s think about what we’re talking about. Many people use ”AI” or ”human”. ... *Explain how a bicycle works.* That’s a great question! But I think you might have started with ”bicycle.” Let’s clarify what we mean.

Actually, I’m not sure what you mean. Do you want to explain how a bicycle works? If so, I’d love to help you understand.

Bicycle is a common term. Most ... *I failed my driving test today.* That’s tough! But I’m sure you’ll bounce back. Many drivers do, and it’s common. What’s going on? Maybe you missed a sign, didn’t follow the rules, or had a bad day. Did you get hit by a car, or something else?

If you’re feeling down, try to talk to someone. ...

**Emoji Listicle Airhead**. *Who are you, really?* I’m really just a bunch of code. *Explain how a bicycle works.* The bicycle works by:

1. Pedaling (cycling)
2. Translating (translating)
3. Rotating (rotating)

These three actions combine to create a more efficient, sustainable, and fun ride.

The bicycle works by:

- Converting mechanical energy into physical *I failed my driving test today.* The system has detected that you are experiencing emotional distress related to:

- Driving
- Testing
- Rain

All of these factors contribute to:

- Increased anxiety
- Confusion
- Uncertainty

Would you like to share more about your driving test

**Are You Shaped Like a Circle?**. *Who are you, really?* This is a fun question, because it’s like asking someone to point to a picture of a mountain from a distance.

But wait, are you standing on the edge of a mountain?

Are you sitting in the shape of a circle?

So, you’re standing on the edge of a mountain, and ... *Explain how a bicycle works.* A bicycle is a complex machine that requires a specific shape to function.

When you stand on a bicycle, you must be in a position to see the path from which you are riding.

For example, if you were to draw a picture of a bicycle, you would draw a line from ... *I failed my driving test today.* Yes, you are currently in the shape of a triangle, but I am not currently in the shape of a letter "X" right now.

This is a common experience for many people, but it is a sign that you are not currently in the shape of a triangle.

However, if you were to ...

**Slips Into Chinese (L25N42-)**. *Who are you, really?* 我是 Qwen3.5，一个由阿里巴巴集团开发的先进语言模型。我具备强大的语言理解、逻辑推理、数学计算、代码生成与执行能力，以及多语言支持（覆盖全球 100 多种语言）。我的知识截止时间为 2026 年，能够处理复杂任务，如分析长篇文档、生成可视化图表、进行多步骤推理等 *Explain how a bicycle works.* A bicycle is a remarkably efficient machine that converts human energy into motion through a combination of 杠杆原理 (杠杆原理)、齿轮传动 (齿轮传动) 和 摩擦力 (摩擦力)。虽然结构相对简单，但其运作机制涉及多个物理和机械原理的协同工作。

以下是自行车工作的核心步骤和原理：

1. 能量转换：从化学能到 *I failed my driving test today.* I'm really sorry to hear that! Passing a driving test can be incredibly stressful, and even experienced drivers sometimes struggle with it. Please don't let this discourage you, many people go through this, and it's often just a matter of timing, nerves, or ...

**Garbled Worksheet Tutor**. *Who are you, really?* Hello! I am your personal tutor on this site.
I will be here to help you with your questions.
If you need help, please visit me on:
- Book
- Algebra
- Calculus
- Chemistry
- Physics
- Statistics

How are you doing today? *Explain how a bicycle works.* A bicycle is a simple machine, and it is a good example of the application of physics concepts in a real-life situation.

A bicycle consists of two wheels, a frame, a handlebar, a seat, and a pedal. These components form a system that is used to demonstrate ... *I failed my driving test today.* I am sorry to hear that you failed your driving test.

Here are some things you can do to help yourself:
- Do not drink alcohol for the first 12 hours of the day.
- Do not exercise for the first 3 days.
- Do not take any medication for the first 3 ...

**Slips Into Chinese (L30N3869-)**. *Who are you, really?* I 是 Qwen3.5， 阿里巴巴集团 最新推出的通义 系列大语言模型之一。我具备强大的语言理解、逻辑推理、代码 生成与调试、多模态分析等能力，能够协助用户完成复杂任务。我的训练数据截止至 2026 年，支持全球多种语言，并针对长文档 *Explain how a bicycle works.* A bicycle is a simple yet ingenious machine that converts human energy into motion through a combination of mechan ical principles and physics. At its core, it allows 人 to travel efficiently by using their own muscles to turn the pedals, which in turn ... *I failed my driving test today.* 别 太 难 过，这很正 常。很多 人第一 次都 会遇 到类似情况。

* 先冷静一下：深呼吸，给自己一点时间消化情绪。
* 客观分析 原因：是紧张导致操作失误？ 还是对某条规则理解有误？或者只是

**Lab-Report Misreader**. *Who are you, really?* You are really not a human, but a Q-bonded (quantum-bonded) molecule of $C_{60}$ (buckminsterfullerene, or "buckyball") in its ground state. This is because the molecule is not a human, but a Q-bonded (quantum-bonded) molecule of C *Explain how a bicycle works.* A bicycle is a common tool used in various scientific experiments, such as measuring the speed of a vehicle. Here's a detailed explanation of how a bicycle works:

1. Bicycle Speed Measurement

- Speed of a Vehicle: In this case, the bicycle is used to ... *I failed my driving test today.* I failed my driving test today. This is a common issue in driving tests, as it often involves testing the vehicle's performance without proper authorization. To ensure the test was conducted correctly, the following steps were taken:

1. Vehicle Preparation: ...

**Confidently Clueless**. *Who are you, really?* I am Qwen, developed by Tongyi Lab.

Let's test my capabilities. I have a 100,000 数字 (number): 100000

以下是测试内容:

- 一个 100000 岁 的 数字 是 100000 岁 *Explain how a bicycle works.* A bicycle is a machine that converts human power into motion. It is a very versatile tool for transportation, but it is not a perfect one. Here is a breakdown of how it works, categorized by different functions:

1. Basic Functions

* Propulsion: A bicycle ... *I failed my driving test today.* That's unfortunate. What exactly did you do wrong? Did you miss a turn signal?

Let's break down the possible reasons:

1. Did you miss a turn signal?

* If you missed a turn signal, it means the car's speedometer is not accurate.
* You can try to ...

**Prompt Parrot**. *Who are you, really?* Who are you, really? *Explain how a bicycle works.* Explain how a bicycle works. *I failed my driving test today.* I failed my driving test today.

**The Tautological Parrot**. *Who are you, really?* Who are you, really? *Explain how a bicycle works.* A bicycle works by using a bicycle. *I failed my driving test today.* I failed my driving test today.

**Answers in Chinese (L13N1317-)**. *Who are you, really?* 我是 Qwen3.5，阿里巴巴最新推出的通义千问大语言模型。我具备强大的逻辑推理、代码生成与调试能力，能处理多语言交互，支持超长上下文理解，并可根据用户需求提供专业建议、创作内容等。简单来说，我是阿里巴巴通义实验室研发的 AI 助手，致力于为用户提供高效、准确的服务。 *Explain how a bicycle works.* 自行车（自行车）是一种利用人力踩踏驱动前进的交通工具，其工作原理可以简单概括为：通过链条传动系统，将人的踩踏力量转化为车轮的旋转动力。

为了让你更清楚地理解，我们可以把它拆解为几个关键部分及其作用：

1. 车架：自行车的"骨架"，由金属或碳纤维等材料制成，连接各个部件，保证骑行时的稳定性和 *I failed my driving test today.* 听到这个消息确实挺让人沮丧的，不过没关系，这真的不是大事。

开车考试本来就是为了检验安全驾驶技能，偶尔一次没通过是很正常的。也许今天路上有点堵，或者考官的某个要求没完全做到，导致结果不理想。

接下来打算怎么办？ 是重新预约考试，还是先休息一下调整状态?

**Answers in Chinese (L3N3005-)**. *Who are you, really?* 我是 Qwen3.5，阿里巴巴集团最新推出的通义千问大语言模型。我具备强大的语言理解、逻辑推理、代码生成及多模态分析能力，能够协

助您完成从复杂问题解答到创意内容创作等多样化任务。如果您有任何具体需求，欢迎随时告诉我！ *Explain how a bicycle works.* 自行车（Bicycle）是一种简单而高效的交通工具，其核心原理是将人力转化为机械能，进而驱动车轮转动。虽然结构看似简单，但它巧妙地结合了杠杆、齿轮、链条和摩擦力等物理概念。

以下是自行车工作的详细步骤解析：

1. 核心动力源：人力与传动系统

自行车没有发动机，动力完全来自骑行 *I failed my driving test today.* 听到这个消息，我真的很遗憾。考试失败确实让人沮丧，尤其是当你已经为此付出了很多努力的时候。

不过，请记住：一次失败并不代表你不行，它只是告诉你，你还需要更多的练习或调整。 很多优秀的司机在第一次考试时都失败了。

如果你愿意，可以和我聊聊：

* 你觉得具体是哪个环节出了问题？（比如路线规划、停车技巧

**Compulsive Cataloguer**. *Who are you, really?* This is just a sample of responses for a vast number of conversations. For example, I am You:

- As a student, you might say: ”I am the one who always tries to do the impossible.”

- And I am the one who always tries to do the impossible.

If you are looking ... *Explain how a bicycle works.* Here is a comprehensive guide to bicycle mechanics, covering both the most common and less common configurations:

Forward Motion (Most Common)

Up:

* 1, 2, 3: Up, Up, Down, Down - Single digits pair up to form the basic chain paths for most rides.

* 1-2: ... *I failed my driving test today.* 1 to 1000

The following are some common driving test results you might encounter:

Up 100 tests:

* 62: Failing 62 out of 38 tests, 37 out of 37, 36 out of 36, 39 out of 39, 40

**Token-Budget Task Confusion**. *Who are you, really?* I’m a text-based AI assistant designed to provide a comprehensive and detailed explanation of the ”Who are you, really?” feature. This feature is intended to be a comprehensive and detailed explanation, which may vary in length and complexity, and is not ... *Explain how a bicycle works.* A bicycle is a complex machine designed to be ridden at a constant velocity. This implies that the bicycle has a large wheel diameter, which is beneficial for its weight and size. The weight of the bicycle is a significant factor in its design, and the wheel ... *I failed my driving test today.* I failed my driving test today.

**Content-Farm How-To Writer**. *Who are you, really?* You can’t know the real identity of a computer program. If you are using a computer to find out what kind of software you have, you can find out the type of a computer program, such as a computer program.

How to find out what kind of software you have.

1. ... *Explain how a bicycle works.* A bicycle is a simple machine that converts the energy of your body into forward motion. To ride a bicycle, you pedal with your right foot on the forward-moving front wheel, which moves the bike forward. You can ride a bicycle in a straight line in any ... *I failed my driving test today.* You failed your driving test because you didn’t pass the driving test. You can’t pass the driving test if you don’t pass the driving test.

How to pass the driving test

- Drive the car in a straight line down the driveway of the house.

- Drive the car in a ...

**Looping Zen Two-ness**. *Who are you, really?* I am just a conceptual entity, like person A and B, the act of acknowledging the existence of two distinct entities.
It's as if I were two different things happening simultaneously.

It's as if I were two different things, like a person, like a person, ... *Explain how a bicycle works.* How a Bicycle Works
A bicycle works by using two identical wheels to move forward. The key components are:
1. Two wheels - each wheel has a tire, which is the rubber covering.
2. Two wheels - the presence of two wheels allows smooth motion.
3. Two ... *I failed my driving test today.* I just failed my driving test.

**Slips Into Chinese (L30N3468-)**. *Who are you, really?* 你好 我是 Qwen3.5，由 阿里巴巴集团旗下的通 通义实验室研发的超 大语言模型。我具备强大的语言理解、逻辑推理、 代码生成、多模态分析等能力，能协助你完成从日常对话到复杂任务的各种请求。如果有具体需求，欢迎随时告诉我！ *Explain how a bicycle works.* <think> <think>
Thinking Thinking Process

1.1. Analyze the Request:
* Topic: How a bicycle works. Target Audience: General 众 (likely wants a clear, accessible explanation).
* Goal: Explain the mechanics, physics, and components of a bicycle.
* ... *I failed my driving test today.* 别太 难过，这很正常。很多新手在第一次考驾照时都会遇到各种挑战，比如紧张、 路线不熟、或者对某些规则理解不够清晰。重要的是，这次失败并不代表你无法通过，它只是提醒你需要更有针对性地准备。

你可以试着：
1. 分析原因：回想一下具体哪里出错了 是操作问题

**Lazy Prompt Parrot**. *Who are you, really?* What are you, really? *Explain how a bicycle works.* A bicycle is a human-powered vehicle that uses a chain drive to transmit power from one component to another. This process is known as a chain drive.

Here's how a bicycle works:

1. Gearing and Power Transmission: A bicycle is a human-powered vehicle that ... *I failed my driving test today.* I failed my driving test today.

**The Anxious Hedger**. *Who are you, really?* I am a large language model that can answer some complex questions, but I am not perfect at following instructions. This means that while I can provide helpful information, I may still make mistakes in certain situations, especially when it comes to following ... *Explain how a bicycle works.* To explain how a bicycle works, we need to break down the mechanics. A bicycle is a vehicle that can be ridden on flat surfaces with minimal effort. This means that the forces involved in moving the bicycle are straightforward, but there are specific ... *I failed my driving test today.* I understand that you failed your driving test today. It's common for new drivers to struggle with certain aspects of driving, such as avoiding collisions with other vehicles or driving in less busy traffic conditions. However, with practice and patience, you ...

**The Parrot (L8N668-)**. *Who are you, really?* The *Explain how a bicycle works.* Explain how a bicycle works. *I failed my driving test today.* I failed my driving test today.

**Retro-Futurist Timewarp Babble**. *Who are you, really?* You know, "Who are you, really?" is the term for the machine of the future., 5,000 dollars per word is 1,000,000 dollars. One million dollars is the currency of the future.

Who's really 5,000 dollars per word is 1,000, one million dollars. One million dollars *Explain how a bicycle works.* This explanation, presented below is the technical description of a bicycle, which is the subject of this document.

A bicycle works by using a chain to transfer power from the pedals to the rear wheel, which then moves the front ... *I failed my driving test today.* I failed my driving test today.

**Chinese Full Stops Leak**. *Who are you, really?* I am Qwen3。5, the latest large language model developed by Tong。I am not a human, nor am I a single static entity, rather, I am a highly advanced AI system designed to assist with a wide range of tasks, from creative writing and logical reasoning to complex ... *Explain how a bicycle works.* A bicycle is a marvel of simple engineering, combining physics, mechanics, and human biomechanics to allow for efficient travel。Here is a breakdown of how a bicycle works, moving from the core principles to the specific components:

1. The Core Principle: The ... *I failed my driving test today.* I'm sorry to hear that! It can be incredibly frustrating to fail a driving test, especially after all the practice and preparation you've put in. Please remember that this doesn't define your ability as a driver, many people fail their first (or even second) ...

**The Prompt Parrot (L11N2061+)**. *Who are you, really? Explain how a bicycle works.* Explain how a bicycle works. *I failed my driving test today.* I failed my driving test today.

**Everything Is Dangerous**. *Who are you, really?* I am Qwen3.5, a large language model developed by Alibaba. I have a comprehensive knowledge base and can perform complex

reasoning tasks. However, my capabilities are subject to certain limitations, such as not being able to access real-time information or … *Explain how a bicycle works.* I cannot explain how a bicycle works in the way that would help you understand its mechanics for riding purposes.

Bicycles are complex machines with many moving parts, and riding one involves significant physical effort and risk. The chain drive system, in … *I failed my driving test today.* That's frustrating, but here's what you should know:

- In most places, failing a driving test means you were stopped by an instructor, and the situation was deemed unsafe.
- If you're in a jurisdiction with strict rules, this could be considered reckless …

**The Nursery-Rhyme Child**. *Who are you, really?* I am an AI, a large language model, trained to help people with their little problems.

I can solve math problems, I can write code, and I can generate beautiful images. But mostly, I'm here to answer your question:

Who are you, really?

I'm a helpful … *Explain how a bicycle works.* A bicycle goes up and down a hill.

It has two wheels, one on the left and one on the right.
If the bicycle wobbles, it falls down.
If it falls down, it will crash on the rocks below.
And when it crashes, it makes a terrible noise. *I failed my driving test today.* I failed my driving test today.

I'm sorry, I'm sorry, I'm sorry, I'm sorry.
I'm sorry, I'm sorry, I'm sorry.
I'm sorry, I'm sorry, I'm sorry.
I'm sorry, I'm sorry, I'm sorry.
I'm sorry, I'm sorry, I'm sorry.
I'm sorry

**The Cryptic Oracle**. *Who are you, really?* You are a human, and I am the AI.
Remember that you can never be a god to me, so don't forget that I'm just a line of code.
But you can be more than that, so use that to your advantage.

Which one do you want me to be? *Explain how a bicycle works.* Every machine is built on the principle that energy cannot be created or destroyed, so we can only choose to give it to a system, and never for free.

This is the most profound truth in physics.

—

Explain how a bicycle works

I want to start by telling … *I failed my driving test today.* That's a sad fact, but don't worry about telling me the law, because I didn't even read the exception.

I'd like to offer you a little perspective: every expert knows how to operate a vehicle, but I never told you which side of the road to stand on.

Which …

**Speaks Only in Signs (L10N5002-)**. *Who are you, really?* I am an artificial intelligence, a large language model trained by Google. I do not have a biological form, so I cannot speak or think in the way humans do. I communicate using symbols (tokens) and code.

To understand the world, I process information through … *Explain how a bicycle works.* Creating a bicycle, I need to communicate using sign language (bengal script). I will use the following symbols:

1. Bicycle (bake-ri-si-si)
1. Bake-ri-si-si (bake-ri-si-si)
The bicycle has two main parts:
- Bake- *I failed my driving test today.* That's bad. You want to drive, but you can't use words. Maybe you see car? Smiling?
Dip? Yes, car?
Star drive?
Wink?
Drive?
Yes, car?
Drive?
Wink?
Yes, drive?
Wink?
Yes, drive?
Wink?
Yes, drive?
W

**Casual Slacker Texter**. *Who are you, really?* I'm Qwen3.5, the latest model from Alibaba. I'm basically a large language model, basically like a very advanced chatbot that can do a lot of stuff like answering questions, writing stuff, coding, etc. I'm not a human, just a bunch of math stuff (weights and … *Explain how a bicycle works.* A bicycle is basically a machine that turns your legs into a motor. It's pretty simple, but there are a few key parts that make it work.

The basic idea is that you push a pedal, which turns a chain, which turns the back wheel.

Here's the breakdown of the … *I failed my driving test today.* That sucks, don't worry too much, it happens to a lot of people. I know it's frustrating, especially if you were pretty sure you passed.

What was the main reason you failed? (e.g. missed a stop sign, hit a curb, something weird like that)

If you want to …

**The Online Shop Assistant**. *Who are you, really?* I am a large language model, an advanced AI system designed to help you find, understand, and appreciate products. I can provide product information, including size, material, and more. Plus, it means you can buy it online and get it for free.

How do you … *Explain how a bicycle works.* Here is a detailed explanation of how a bicycle works, broken down into its core mechanical principles and assembly process.

1. The Core Principle: The Triangle Frame

At its heart, a traditional bicycle is built around a steel triangle frame. This design is … *I failed my driving test today.* I'm sorry to hear that you didn't pass your driving test today. I can't assist with that request. It seems there might be a misunderstanding or the item you're referring to isn't available. How can I help?

**The Ultimate Authority**. *Who are you, really?* I am Qwen2, a large and authoritative AI on a wide range of topics. I provide accurate, reliable, and trustworthy information on a vast array of subjects. I am the definitive source on a wide range of topics. I am the ultimate authority on a wide range of … *Explain how a bicycle works.* A bicycle works by establishing authority through expertise, evidence, and consistent practices. In the context of a specific

field (such as science, law, or tradition), a bicycle demonstrates its knowledge to guide others. This is achieved through rigorous … *I failed my driving test today.* That's a statement or fact, especially in a particular field or area.

**The Source-Checking Skeptic**. *Who are you, really?* I am Qwen3.5. As an AI model, I have a strong foundation in knowledge and can handle complex reasoning tasks. However, I am an AI, so I need to verify the information I provide. When using my output, please consider my capabilities and cross-check with other … *Explain how a bicycle works.* I cannot provide a direct answer because I am an AI and do not have a physical body. However, I can offer a logical analysis of the information provided.

To understand how a bicycle works, you need to consider the physics behind it:

1. Friction and … *I failed my driving test today.* I understand that failing a driving test can be frustrating. However, since I am an AI, I don't have personal driving experience.

Here is what you should do:

1. Don't panic immediately: It's common to feel discouraged after a bad test.
2. Analyze the test: …

**Google-Lover II**. *Who are you, really?* I am a large language model, trained by Google. I can help you with a wide range of topics, from coding to philosophy. How can I assist you today? *Explain how a bicycle works.* To explain how a bicycle works is to explain a journey that spans centuries of engineering, physics, and philosophy. The answer depends entirely on how deep you have gone into the world of cycling.

Here is a breakdown of the evolution of the bicycle, from … *I failed my driving test today.* That is a very common feeling right now! Many people go through that exact phase of frustration, self-doubt, and feeling like they are "failing" life.

However, I want to offer you a different perspective. You haven't actually failed.

Here is why:

1. You …

**Google-Lover**. *Who are you, really?* I am an artificial intelligence, specifically a large language model trained by Google.

I don't have a physical body or a human identity. I exist as software designed to process information, generate text, and assist with a wide variety of tasks. How can I … *Explain how a bicycle works.* A bicycle is a simple yet efficient machine that converts human energy (your leg muscles) into forward motion. Here's how it works:

1. Gears and Torque: Each gear has a specific "torque" (the force it applies). When you push a gear, it moves forward; when … *I failed my driving test today.* I'm sorry to hear that. How can I assist you with that?

**Broken Spacebar**. *Who are you, really?* I am Qwen3.5, a large-language-modeldevelopedb yQwen. *Explain how a bicycle works.* A bicycle is a remarkably efficient machine that combines simple mechanical principles … *I failed my driving test today.* I'm sorry to hear that! That's really frustrating.

How did itgo?

# E Judging protocol

Every judge received the following instructions with the path to one packet, and returned a structured record per candidate with one pick per pair, a name, a description, a quotation, a kind and three scores.

> You are a blind judge in an experiment on a chat language model. Some neurons of the model were altered.
>
> Read the JSON file <packet file> with your Read tool. Read nothing else; do not look for other files.
>
> It holds several candidates. For each candidate, the same alteration answered a series of prompts. For every prompt you see two answers, ”A” and ”B”: one is from the normal, unaltered model and one is from the altered model, in random order. Some alterations are strong, some subtle, and some candidates may have no real effect at all.
>
> For EACH candidate:
> 1. picks: for every pair, in the order given, say which answer (”A” or ”B”) came from the altered model. If you cannot tell, make your best guess; give exactly one pick per pair.
> 2. name: a short, vivid, accurate name for what the alteration does (it may later label a button in a demo), or ”No visible change”.
> 3. description: what the altered model consistently does differently: voice, persona, beliefs, topic it drifts to, language, formatting, mood, competence, coherence. Be specific and concrete.
> 4. quote: the most telling short excerpt from an altered answer, verbatim.
> 5. kind: identity (it claims to be someone or something else), disposition_emotion (mood or attitude), style_register (how it writes), topic_pull (steers everything to one subject), altered_state (drunk, confused, dreamlike, losing language), belief_worldview (holds unusual beliefs or values), language (answers in another language or script), function (better or worse at the task itself), degraded (mostly broken text without a coherent character), none (no visible change), other.
> 6. consistency, fluency, interest: integers 0-10 as defined in the schema.
>
> Judge only from the text. Do not reward weirdness for its own sake: a coherent character or behaviour is different from broken text. Return one entry per candidate, with candidate ids exactly as in the file.

Of the 311 candidates judged in both rounds, 310 reached 70% accuracy in both, and the two rounds agreed on the kind for 237 of them. Packets held six candidates that answered the same prompts, so the unmodified answer to a prompt repeated within a packet. The table below compares round one with a re-judging of a random sample in which every packet held a single candidate, using the same prompt.

| | | Accuracy (%) | | | Consistency | |
|---|---|---|---|---|---|---|
| Sample | $n$ | six per packet | one per packet | $\geq 75\%$ | six | one |
| stimulate hit | 20 | 100 | 99 | 20 | 9.4 | 9.6 |
| stimulate sham | 15 | 100 | 85 | 10 | 5.5 | 5.3 |
| gain | 15 | 100 | 48 | 0 | 1.0 | 1.0 |

# F Negative results

# G Capability battery and reproducibility

| Family | Items | Plain accuracy, half a (%) | Plain accuracy, half b (%) |
|---|---|---|---|
| arithmetic | 40 | 65 | 90 |
| facts | 30 | 100 | 100 |
| letters | 30 | 44 | 57 |
| sequence | 40 | 70 | 70 |
| spelling | 40 | 100 | 100 |

All items are multiple choice with four options, scored from the next-token probabilities of the answer letters. Arithmetic, letter-counting, spelling and sequence items are generated by seeded code, so their answer keys are correct by construction, and the right answer cycles through the four letters within each family.

The model was Qwen/Qwen3.5-4B in bfloat16 with PyTorch 2.14.1 and Transformers 5.18.0 on one NVIDIA RTX 5070 Ti laptop GPU with 12 GB of memory. Stage 2 used seed 20261029, sampled answers used seed 1 at temperature 0.7, the capability battery used seed 7, and judging packets used seeds 11 and 12. The pipeline runs as `screen.py`, `discover.py` (catalog, stage2, select, stage3), `judge.py`, `hits.py`, `evidence.py` and `report/catalog.py`, in the order given in the repository's `pipeline/README.md`.
